

MATLAB Introduction

MATLAB stands for MATrix LABoratory

It provides an easy-to-use interface to perform mathematical computations, create plots, analyze data etc

▶ Variable definition: $x = 5$

▶ Matrix definition: $A = [16\ 3\ 2\ 13; 5\ 10\ 11\ 8; 9\ 6\ 7\ 12; 4\ 15\ 14\ 1]$

$A =$

16 3 2 13

5 10 11 8

9 6 7 12

4 15 14 1

In general : matrix = [line 1; line 2... ; line N]

Useful note: indices start from 1 and not from 0!

Lot of useful functions:

- ▶ sum
- ▶ mean
- ▶ median
- ▶ abs
- ▶ ...

You can also create your own functions
as in every other programming language

```
▶ function [ return variables ] = function_name( arguments )  
    ▶ ...  
    ▶ ...  
    ▶ ...  
    ▶ ...  
▶ end
```

And for loops...

- ▶ for i = starting value : step : ending value
 - ▶ ...
 - ▶ ...
 - ▶ ...
 - ▶ ...
- ▶ end

And if statements...

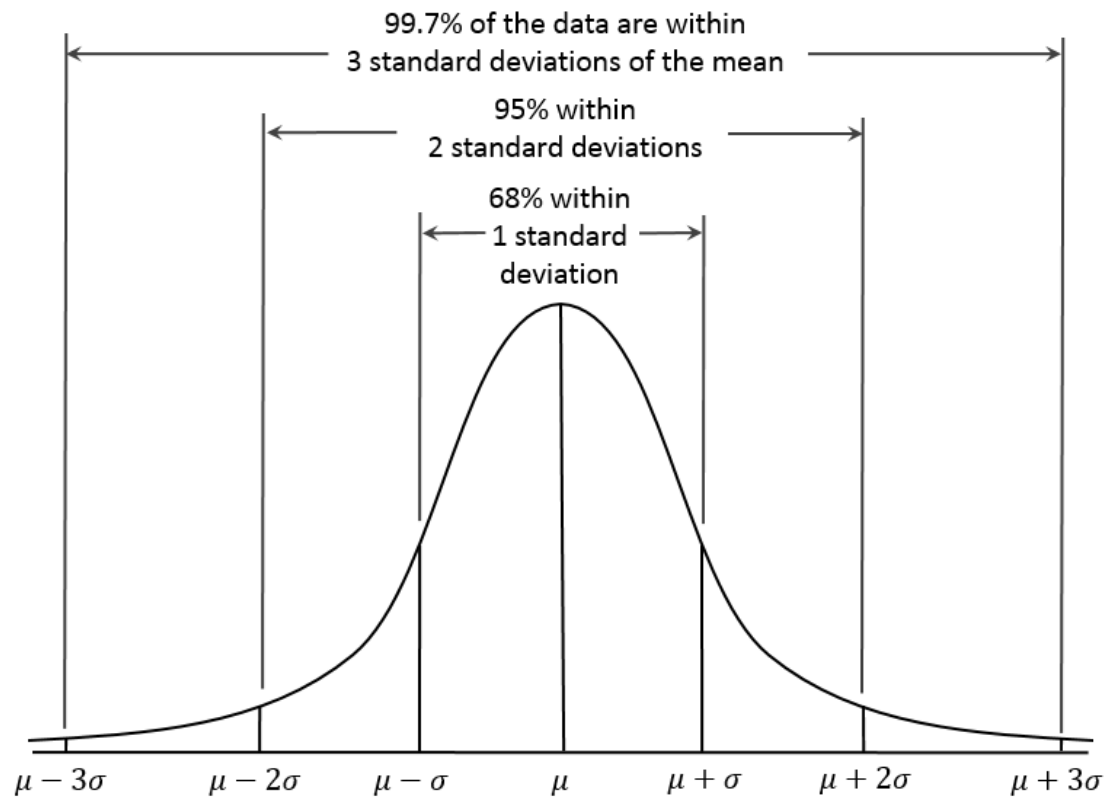

- ▶ if condition1==TRUE ...
 - ▶ ...
- ▶ elseif condition2==TRUE
 - ▶ ...
- ▶ else
 - ▶ ...
- ▶ end

How to plot data:

- ▶ `figure`
- ▶ `plot(x,y)`
- ▶ `xlabel('x axis name')`
- ▶ `ylabel('y axis name')`
- ▶ `title('title of plot')`
- ▶ `legend('line 1','line 2',...)` % if you plot more than two lines

Standard deviation std function

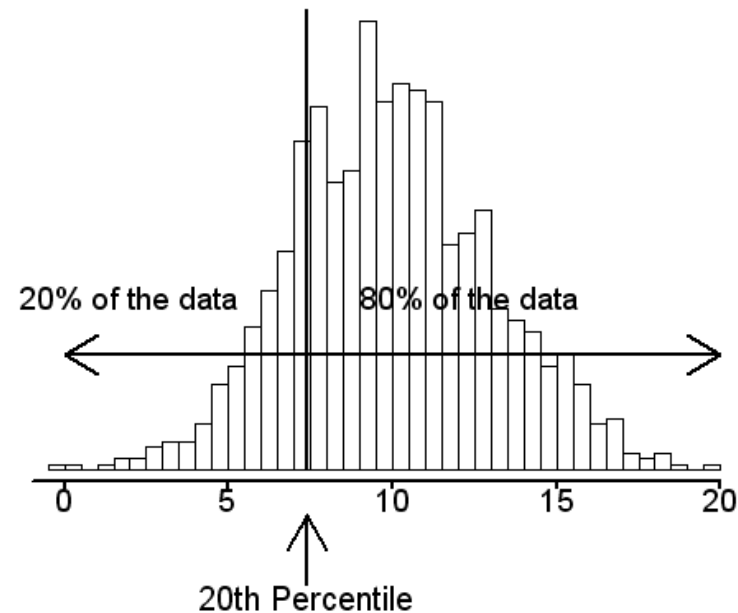

Gaussian distribution

Percentiles

a percentile is a number where a certain percentage of scores fall below that number

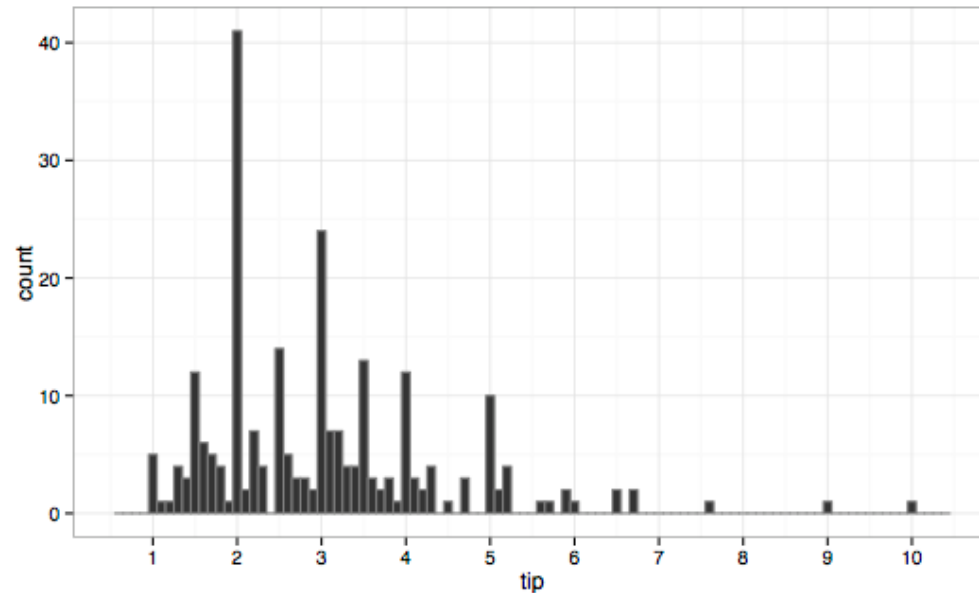

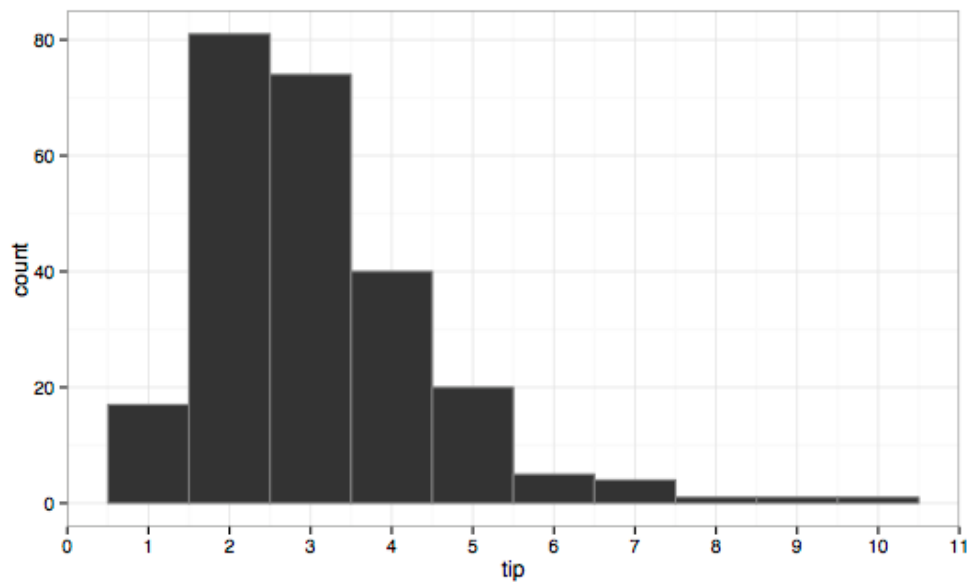

► `x = prctile(vector, desired percentile)`

Question: What is the value of the 50th percentile on the Gaussian?

You can also see interesting things by creating a histogram

histogram(x)

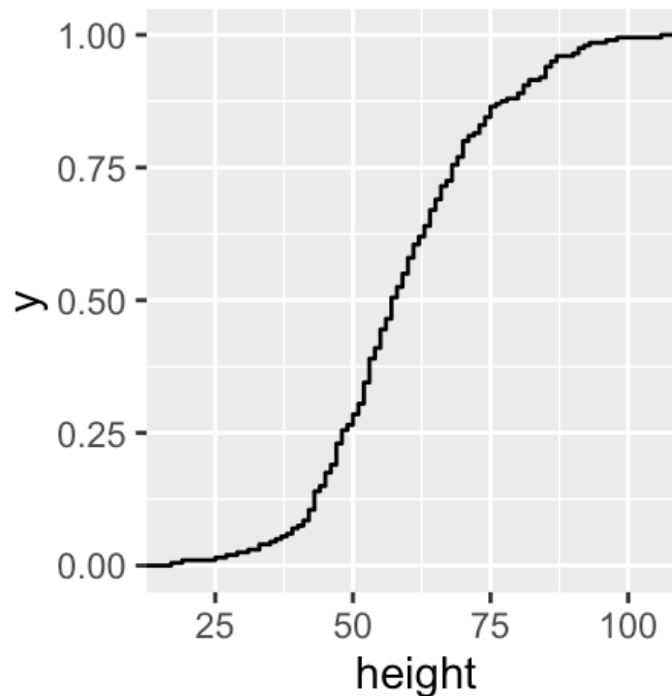

You can also specify the bins that are created by setting the number of bins

► `histogram(x, bin_number)`

Cumulative distribution function

a function whose value is the probability that a corresponding continuous random variable has a value less than or equal to the argument of the function

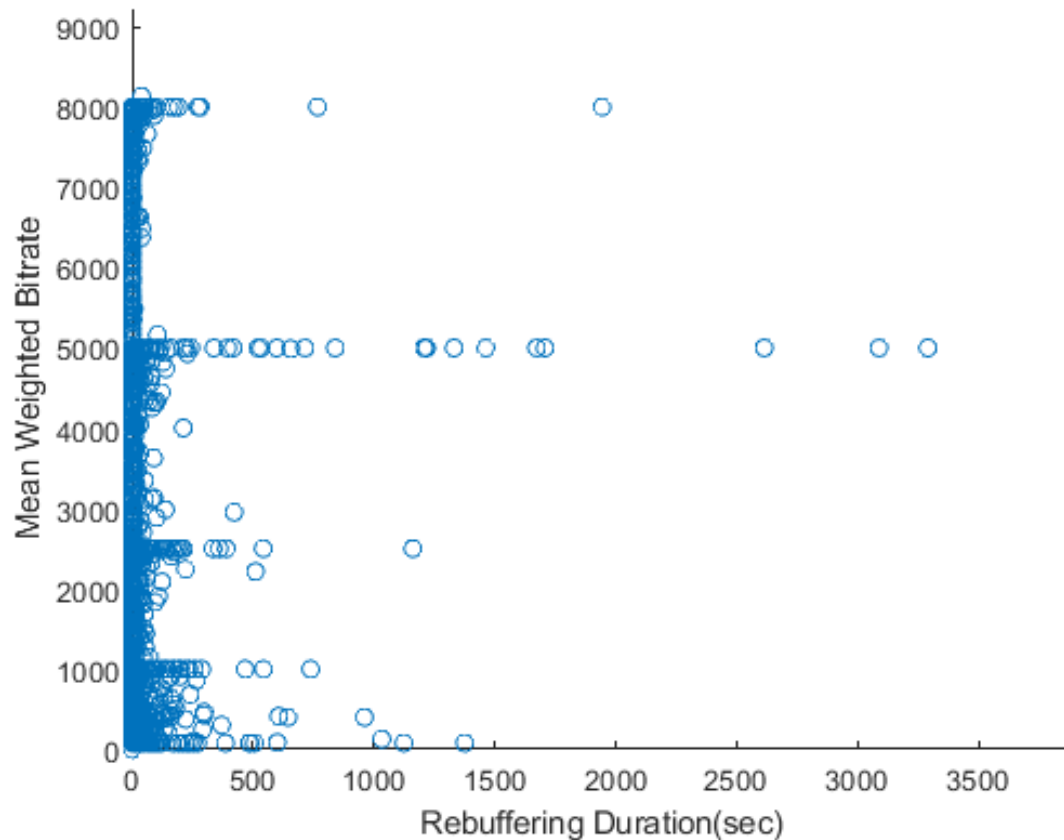

- ▶ `[y ,x] = ecdf(vector);`
- ▶ `plot(x,y)`

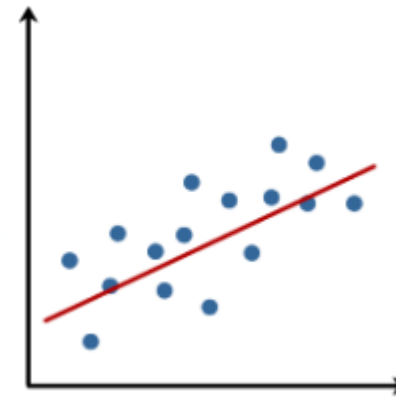

Can you spot the 50th percentile here?

You can plot two variables together to discover how they are related!

► `scatter(var1, var2)`

Note that here we cannot see any linear relation between the variables

use **`corr()`** function to check if two variables are linearly correlated

`corr(x,y)` - Pearson Correlation

How to interpret it?

Pearson Correlation is a measure of the linear correlation between two variables.

It takes values in $[-1, 1]$

- ▶ *Negative value* (negative correlation) means that when x is incrementing, y is decreasing.
- ▶ *Positive value* (positive correlation) means that when x is incrementing, y is incrementing too.
- ▶ *Zero correlation* means that data are randomly distributed.

The background features abstract, overlapping geometric shapes in various shades of blue, ranging from light sky blue to deep navy blue. These shapes are primarily located on the right side of the image, creating a modern, layered effect.
