Δυναμικές Μνήμες - DRAM
Βασικό Block Diagram
Υποσυστημάτων Μνήμης

Address Decoder

n Address Bits

m Bit Lines

Memory cell

2^n word lines

Word Line

RAM/ROM ονοματολογία:

32 X 8, "32 by 8" => 32 8-bit words

1M X 1, "1 meg by 1" => 1M 1-bit words
Κελί μνήμης με 1 transistor (DRAM)

- Εγγραφή - Write:
  1. Οδηγούμε την bit line
  2. Επιλέγουμε γραμμή (row select)

- Ανάγνωση - Read:
  1. Προφορτίζουμε (precharge) την bit line σε Vdd/2
  2. Επιλέγουμε γραμμή (row select)
  3. Το κελί και η bit line μοιράζονται τα φορτία (charge sharing)
  4. Sense στην bit line (sense amplifier)
     Μπορεί να ανιχνεύει πολύ μικρές αλλαγές
  5. Write: επαναφέρουμε την τιμή

- Ανανέωση - Refresh:
  - Αρκεί ένα απλό read σε κάθε κελί
Κλασσική Οργάνωση DRAM (τετραγωνική)

Square keeps the wires short: Power and speed advantages
Less RC, faster precharge and discharge is faster access time!
Λογική Οργάνωση DRAM (4 Mbit)

4 Mbit = 22 address bits
11 row address bits
11 col address bits

- Square root of bits per RAS/CAS
  - Row selects 1 row of 2048 bits from 2048 rows
  - Col selects 1 bit out of 2048 bits in such a row
Τα σήματα της DRAM

- Σήματα ελέγχου (RAS_L, CAS_L, WE_L, OE_L) όλα active low
- Κοινό bus δεδομένων D - εισόδου και εξόδου (Din & Dout):
  - WE_L ενεργοποιείται (Low), OE_L απενεργοποιείται (High)
    - Δ χρησιμοποιείται σαν είσοδος στην DRAM
  - WE_L απενεργοποιείται (High), OE_L ενεργοποιείται (Low)
    - Δ χρησιμοποιείται σαν εξόδος από την DRAM
- Οι διευθύνσεις γραμμής και στήλης μοιράζονται τα ίδια pins (A)
  - RAS_L ενεργοποιείται (low) -> A αποθηκεύεται σαν row address
  - CAS_L ενεργοποιείται (low) -> A αποθηκεύεται σαν column address
  - RAS/CAS edge-sensitive
Απλοποιημένο διάγραμμα χρονισμού DRAM

• Η διεύθυνση δίνεται σε 2 βήματα
Τυπικός χρονισμός Ανάγνωσης DRAM

- Κάθε προσπέλαση DRAM ξεκινάει με:
  - Ενεργοποίηση του RAS_L
  - 2 τρόποι ανάγνωση: early or late

**Early Read Cycle:** OE_L asserted before CAS_L

**Late Read Cycle:** OE_L asserted after CAS_L
Τα βήματα για Early Read

• Assert Row Address
• Assert RAS_L
  – Start read cycle
  – Meet Row Addr setup time before RAS/hold time after RAS
• Assert OE_L
• Assert Col Address
• Assert CAS_L
  – Meet Col Addr setup time before CAS/hold time after CAS
• Valid Data Out after access time
• Disassert OE_L, CAS_L, RAS_L to end cycle
Τα βήματα για Late Read

• Assert Row Address
• Assert RAS_L
  - Start read cycle
  - Meet Row Addr setup time before RAS/hold time after RAS
• Assert Col Address
• Assert CAS_L
  - Meet Col Addr setup time before CAS/hold time after CAS
• Assert OE_L
• Valid Data Out after access time
• Disassert OE_L, CAS_L, RAS_L to end cycle
Τυπικός χρονισμός Εγγραφής DRAM

- Κάθε προσπέλαση DRAM ξεκινάει με:
  - Ενεργοποίηση του RAS_L
  - 2 τρόποι εγγραφής: early or late

**Early Wr Cycle:** WE_L asserted before CAS_L

**Late Wr Cycle:** WE_L asserted after CAS_L
Key DRAM Timing Parameters

- $t_{RAC}$: minimum time from RAS line falling to the valid data output.
  - Quoted as the speed of a DRAM
  - A fast 4Mb DRAM $t_{RAC} = 60$ ns
- $t_{RC}$: minimum time from the start of one row access to the start of the next.
  - $t_{RC} = 110$ ns for a 4Mbit DRAM with a $t_{RAC}$ of 60 ns
- $t_{CAC}$: minimum time from CAS line falling to valid data output.
  - 15 ns for a 4Mbit DRAM with a $t_{RAC}$ of 60 ns
- $t_{PC}$: minimum time from the start of one column access to the start of the next.
  - 35 ns for a 4Mbit DRAM with a $t_{RAC}$ of 60 ns
DRAM with Column buffer

A0...A10

Address Buffer

Row Decoder

... Memory Array (2,048 x 2,048)

Word Line

Storage Cell

Sense Amps

Column Latches

Data Out

Data In

Pull column into fast buffer storage

Access sequence of bit from there
Optimized Access to Cols in Row

- Often want to access a sequence of bits
- Page mode
  - After RAS / CAS, can access additional bits in the row by changing column address and strobing CAS
- Static Column mode
  - Change column address (without repeated CAS) to get different bit
- Nibble mode
  - Pulsing CAS gives next bit mod 4
- Video ram
  - Serial access
256 Mbit SDRAM Addressing

256 Mbit chip: 8192 rows, 512 columns, x16 data, 4 banks
Functional Block Diagram
8 Meg x 16 SDRAM
SDRAM Details

- Multiple “banks” of cell arrays are used to reduce access time:
  - Each bank is 4K rows by 512 “columns” by 16 bits (for our part)
- Read and Write operations as split into RAS (row access) followed by CAS (column access)
- These operations are controlled by sending commands
  - Commands are sent using the RAS, CAS, CS, & WE pins.
- Address pins are “time multiplexed”
  - During RAS operation, address lines select the bank and row
  - During CAS operation, address lines select the column.
- “ACTIVE” command “opens” a row for operation
  - Transfers the contents of the entire to a row buffer
- Subsequent “READ” or “WRITE” commands modify the contents of the row buffer.
- For burst reads and writes during “READ” or “WRITE” the starting address of the block is supplied.
  - Burst length is programmable as 1, 2, 4, 8 or a “full page” (entire row) with a burst terminate option.
- Special commands are used for initialization (burst options etc.)
- A burst operation takes \( \approx 4 + n \) cycles (for n words)
Mode Register

SDRAM Device can be programmed to respond in slightly different manners

Burst Length = 1, 2, 4, 8, or Page mode
CAS Latency = 2, 3 (4, 5, etc in special versions)
Burst Type = Sequential or Interleaved
Βασικές Χρονικές Παράμετροι SDRAM

• $t_{RCD}$ : ACTIVE to READ or WRITE delay
• $CL$ : CAS Latency
• $t_{RAS}$ : ACTIVE to PRECHARGE time
• $t_{RP}$ : PRECHARGE Period
• $t_{WR}$ : WRITE recovery time
• $t_{RC}$ : ACTIVE to ACTIVE time
READ burst (with auto precharge)
WRITE burst (with auto precharge)
DDR Read Command (with auto precharge)
DDR Read Command (without auto precharge)
DDR: Consecutive Read Bursts
DDR Write Command (without auto precharge)
DDR: Read - Burst Stop - Write
Volatile Memory Comparison

The primary difference between different memory types is the bit cell.

- **SRAM Cell**
  - Larger cell ⇒ lower density, higher cost/bit
  - No dissipation
  - Read non-destructive
  - No refresh required
  - Simple read ⇒ faster access
  - Standard IC process ⇒ natural for integration with logic

- **DRAM Cell**
  - Smaller cell ⇒ higher density, lower cost/bit
  - Needs periodic refresh, and refresh after read
  - Complex read ⇒ longer access time
  - Special IC process ⇒ difficult to integrate with logic circuits
  - Density impacts addressing
