

HY 351: Ανάλυση και Σχεδίαση Πληροφοριακών Συστημάτων CS 351: Information Systems Analysis and Design

II. (Development) Methodologies Μεθοδολογίες Ανάπτυξης

...

Lecture : 2 Date : 29-9-2005 Yannis Tzitzikas

University of Crete, Fall 2005

- · Common problems in Information Systems Development
- · What is a (Software Development) methodology?
- The fundamental 4-phase model
 - planning, analysis, design, implementation
- · Methodologies
- · How we select a methodology?
- · Process Improvement Models

U. of Crete, Information Systems Analysis and Design

Zannie Tritrikae Eatl 2005

<u>Common Problems</u> in Information Systems Development

The current status in software engineering

The Spandish Group report, 2003:

- only one out of three software projects complete on-time and on-budget.
- · 42% of all corporate IS projects were abandoned before completion
- Most errors (54%) are detected <u>after</u> coding and testing.
- Almost half of all errors (45%) are introduced during requirements and design.
- Most errors made during requirements analysis are non-clerical (77%)
- Requirements errors can cost up to 100 times more to fix than implementation errors - if they are not caught early on

Many failed systems were abandoned because analysts tried to build wonderful systems without understanding the organization.

The primarily goal is to create value for the organization.

==> Need to do requirements and design right!

U. of Crete, Information Systems Analysis and Design

V---i- T-it-ib-- E-II 200

Problems in IS Development

What can go wrong?

• It is only by understanding what can go wrong during a system development project that we can hope to avoid failure

J. of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

Problems from an <u>End User's perspective</u>

- · What system? I haven't seen a new system
- It might work, but it's dreadful to use!
- It's very pretty but does it do anything useful?

U. of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

6

Problems from a <u>Client's perspective</u>

- · If I'd known the real price, I'd never have agreed
- · It's no use delivering it now we needed last April!
- Ok, so it works but the installation was such a mess my staff will never trust it!
- · I didn't want it in the first place
- Everything's changed now we need a completely new system

Problems from a <u>Developer's perspective</u>

- We built what they said they wanted
- · There wasn't enough time to do it any better
- Don't blame me I've never done object-oriented analysis before
- How can I fix it? I don't know how it's supposed to work
- We said it was impossible, but no-one listened
- · The system's fine the users are the problem

Causes of IS project failure (Flynn'98)

Type of Failure	Reason for failure	Comment	
	The wrong problem is addressed	System conflicts with business strategy	
	Wider influences are neglected	Organization culture is ignored	
Quality	Analysis is carried out incorrectly	Poorly skilled team, too small	
problems	Project undertaken for wrong reason	Technology pull or political push	
Productivity Problems	Users change their minds External events change the environment Implementation is not feasible Poor project control	New legislation May not known, until project start Inexperienced project manager	

Τα αίτια της αποτυχίας

Η αποτυχία πολλές φορές οφείλεται σε κινδύνους (ρίσκα) που δεν λήφθηκαν υπόψη και δεν έγινε σωστό πλάνο αντιμετώπισής τους

Ρίσκο ~ μέτρο της αβεβαιότητας ως προς το αποτέλεσμα Υψηλό ρίσκο => αύξηση κόστους, πρόκληση καθυστερήσεων Ρίσκο = f(διαθέσιμης πληροφορίας)

Όσο λιγότερη και χαμηλότερης ποιότητας πληροφορία έχουμε, τόσο μεγαλύτερο το ρίσκο

Associated Risks

Kinds of Risks:

- Requirements
 - · avoid the big danger, i.e. build the wrong system (the one that does not satisfy customers
- **Technological**
 - · the selected technology will work?
 - Will the various pieces fit together ?
- Skill
 - will I get the staff and expertise I need?
- Political
 - are there political forces that can get in the way and seriously affect the project ?

Yannis Tzitzikas, Fall 2005

Πληροφοριακά Συστήματα και .. Ηθική (επιπτώσεις πληροφοριακών συστημάτων)

Τα αποτελέσματα της εγκατάστασης ενός ΑΤΜ έξω από ένα σουπερμάρκετ:

Ομάδα

11

- Ταμίες Τραπεζών
- Πελάτες Τραπεζών
- Πελάτες Σουπερμάρκετ
- Μέτοχοι Τράπεζας
- Κάτοικοι περιοχής
- Μέτοχοι Σουπερμάρκετ
- Αποτέλεσμα εγκατάστασης ΑΤΜ
- Απώλεια θέσεων εργασίας
- Καλύτερη εξυπηρέτηση
- Χειρότερη εξυπηρέτηση (συμφόρηση πάρκινγ)
- Αύξηση μερίσματος
- Αύξηση μερίσματος (λόγω του ΑΤΜ ψωνίζουν επίσης)
- Αύξηση ρύπανσης, κυκλοφορίας

Ένα πληροφοριακό σύστημα μπορεί να επηρεάσει τη ζωή πολλών ανθρώπων

Yannis Tzitzikas, Fall 2005

What is a (Software Development) Methodology?

- Defines activities and organizational procedures used in software production and maintenance
- · A process model (methodology):
 - states an order of carrying out activities
 - $\,-\,$ specifies what development $\underline{\text{artefacts}}$ are to be delivered when
 - assigns activities and artefacts to developers
 - offers criteria for <u>monitoring</u> a project's progress, for <u>measuring</u> the outcomes, and for <u>planning</u> future projects
- Is not susceptible to standardisation

U. of Crete, Information Systems Analysis and Design

Vannie Tritrikae Eall 2005

E 11 2005

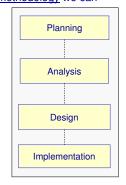

The fundamental 4-phase model

The fundamental 4-phase model (planning, analysis, design, implementation)

In <u>every project</u> and in <u>every development methodology</u> we can identify some fundamental <u>phases</u>

- Each phase consists of <u>steps</u>, rely on <u>techniques</u>, and produces <u>deliverables</u>
- Different methodologies specify different order between these
 - they specify how exactly we will work.

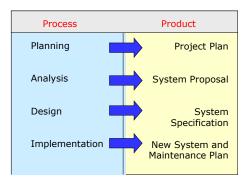

of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

The fundamental 4-phase model (planning, analysis, design, implementation)

Yannis Tzitzikas, Fall 2005

Planning

- Why and how the IS should be built
- · Two steps
 - 1. At project initiation, the system's value to the organization is identified
 - how it will *lower costs* or *increase benefits*?
 - A <u>system request</u> describes in brief the <u>business need</u>, and it explains how a system that supports the need will create business value. The IS department works together with the person or department that generated the request (called <u>project sponsor</u>) to conduct a <u>feasibility analysis</u> which examines key aspects of the proposed project:
 - technical feasibility (can we build it?)
 - economical feasibility (will offer business value?)
 - organizational feasibility (if we build it, will it be used?)
 - The system request and feasibility study an <u>approval committee</u> (or steering committee) which decides whether the project should be undertaken.
 - 2. Once the project is approved it enter into <u>project management</u>
 - the project manager creates a workplan, staffs the project and monitors and controls the progress. Deliverable: <u>project plan</u>

of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

18

- · Its objective is to answer the questions:
 - who will use the system
 - what the system will do
 - $-\ \underline{\text{where}}$ and $\underline{\text{when}}$ it will be used

Steps

- 1. <u>Analysis strategy</u>. Analysis of the current system and its problems and ways to design a new system
- 2. <u>Requirements Gathering</u> (through interviews, questionnaires). The concept of the new system will then used to describe how the business will operate with the new system
- 3. The analyses, system concept and models are then combined into one document called <u>system proposal</u>, which is then given to key person in order to decide whether the project should be continued

II. of Crete. Information Systems Analysis and Design

annis Tzitzikas, Fall 2005

Design

 hardware, software and network infrastructure, the UI, forms and reports, databases, files, etc

· Steps:

- 1. <u>Design Strategy.</u> Developed by company itself or outsourced to another firm, or buy an existing software package
- 2. <u>Architecture Design</u>: hardware, software and network infrastructure, the UI, forms and reports, databases, files, etc
- 3. <u>Database and file specifications</u>: define exactly what data will be stored and where
- 4. Program design: programs that need to be written and what each will do.

Outcome:

<u>System Specification</u> that is given to the programming team for implementation

U. of Crete, Information Systems Analysis and Design

annis Tzitzikas, Fall 2005

21

- Commonly, this is the longest and most expensive part of the process.
- Steps
 - 1. Construction
 - 2. <u>Installation</u>: The new system replaces the existing (completely, in parallel, phased conversion strategy), training plan.
 - 3. <u>Support Plan</u>: formal and informal post-implementation review, as well as a systematic way for identifying changed needed for the system

Methodologies

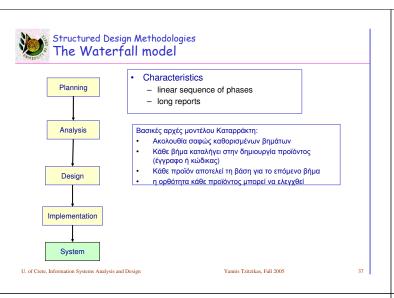

Categorizing Methodologies

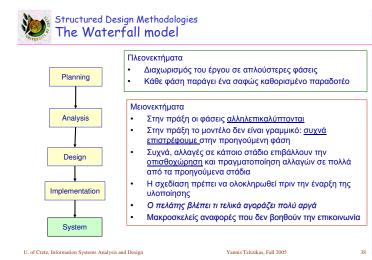

- no-methodology (code-and-fix)
- structured design
 - · Waterfall, Parallel
- evolutionary / rapid application development (RAD)
 - Phased, Prototyping, Throwaway prototyping
 - RUP (Rational Unified Process)
- Agile Development
 - XP (eXtreme Programming)
- By reuse
- Others:
 - Transformational
 - MDA (Model Driven Architecture)

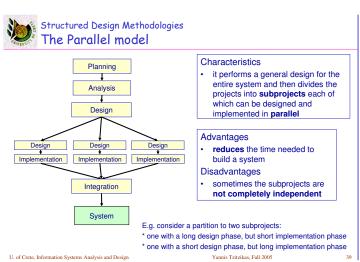

U. of Crete, Information Systems Analysis and Design

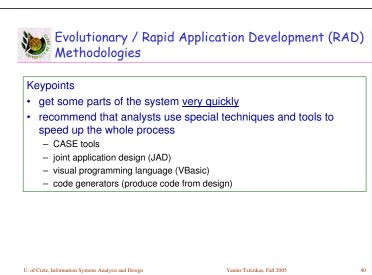

Yannis Tzitzikas, Fall 2005

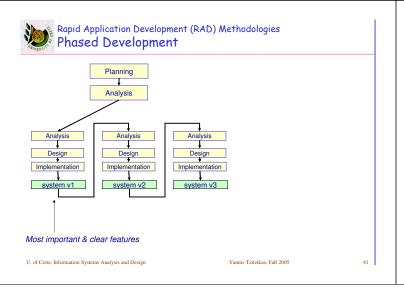

36

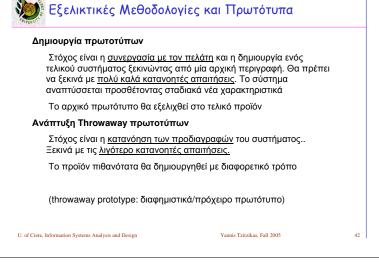

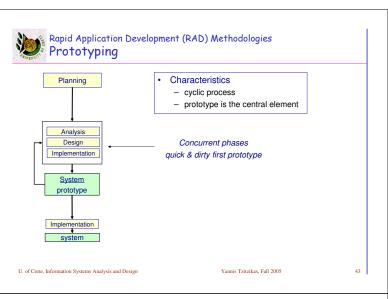

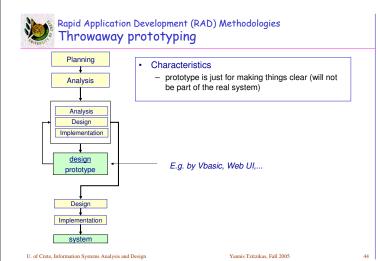

Rapid Application Development (RAD) Methodologies

Πλεονεκτήματα

- Αντιμετωπίζει την <u>ασάφεια</u> στις απαιτήσεις
- Παρέχει τη δυνατότητα στον πελάτη να αλλάξει γνώμη πριν υπογράψει
- Μείωση χρόνου ανάπτυξης
- Αρχικά πρωτότυπα χρησιμοποιούνται για εξοικείωση από τους χρήστες
- Μεγαλύτερη πιθανότητα ανάπτυξης <u>φιλικού</u> προς το χρήστη λογισμικού
- Ο <u>πελάτης εμπλέκεται</u> στην ανάπτυξη του προϊόντος
- Αυξανόμενη σταδιακά ικανοποίηση του πελάτη
 Επικοινωνία χρηστών / ομάδος ανάπτυξης

Προβλήματα

- Έλλειψη παρατήρησης στη διαδικασία (αδυναμία πρόβλεψης επαναλήψεων)
- Συστήματα λιτά δομημένα λόγω συχνών αλλαγών
- Εστίαση στη λειτουργικότητα Λιγότερη έμφαση στις μη λειτουργικές απαιτήσεις
- Ειδικές ικανότητες μπορεί να απαιτηθούν (π.χ. γλώσσες για rapid prototyping)
- Υπερβολικός ενθουσιασμός από τον πελάτη. Ενδεχόμενη υποεκτίμηση του χρόνου ανάπτυξης
- Η δυνατότητα για συνεχείς τροποποιήσεις μειώνουν το βαθμό ικανοποίησης

Yannis Tzitzikas, Fall 2005

NO SERVICE SER

Rapid Application Development (RAD) Methodologies

Εφαρμογή

- Για μικρά ή μεσαίου μεγέθους συστήματα (το αρχικό πρωτότυπο πλησιάζει το τελικό προϊόν)
- Για τμήματα μεγάλων συστημάτων (π.χ. η επαφή χρήσης ενός συστήματος εναέριας κυκλοφορίας)
- Για συστήματα με μικρό χρόνο ζωής
- Για συστήματα όπου υπάρχει αδυναμία έκφρασης των απαιτήσεων από πριν

Ακατάλληλη για:

- λογισμικό ενσωματωμένων συστημάτων

Agile software development

- λογισμικό πραγματικού χρόνου
- επιστημονικό λογισμικό

U. of Crete, Information Systems Analysis and Design

evelopme

Development Models

Yannis Tzitzikas, Fall 2005

Agile Development Methodologies

- · Programming-centric methodologies
- few rules and practises (easy to follow)
- · aim at eliminating the modelling and documentation overhead
- emphasise simple and iterative development
- www.agileAlliance.org
- Examples
 - eXtreme Programming (XP)
 - Scrum
 - Dynamic Systems Development Method (DSDM)

Acceptance tests Continuous integration

User stories

Keypoints

- Individuals and interactions over processes and tools
- Working software over comprehensive documentation
- customer collaboration over contract negotiation
- responsibility to change over following a plan

Best known representatives

- eXtreme Programming (XP)
- Aspect Oriented Software Development
- Feature-driven Development
- Lean Development

.....

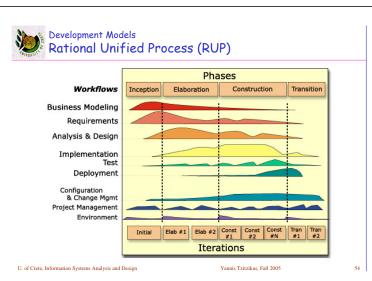

How we Select a Methodology?

Selecting the Appropriate Development Methodology

- · No methodology is best for every case
- · Criteria
- Clarity of User Requirements
 - Familiarity with Technology
 - System Complexity
 - System Reliability
 - e.g. a missile control system
 - Short Time Schedules
 - Schedule Visibility

U. of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

Process Improvement Models

Process Improvement Models

- Every organization engaged in software production wants to improve its development process.
- To improve, the organization has to know the problem of its current process
- Process Improvement Models
 - Capability Maturity Model (CMM)
 - ISO 9000 family of quality standards

Process Improvement Models

Capability Maturity Model (CMM)

- Capability Maturity Model (CMM)
 - "the stairway to software excellence"
 - A popular method for process assessment and improvement
 - is essentially a questionnaire that an IT organization fills in
 - The questionnaire if followed by a verification and attestation process, which assigns the organization to one of the five CMM levels (the higher the better)

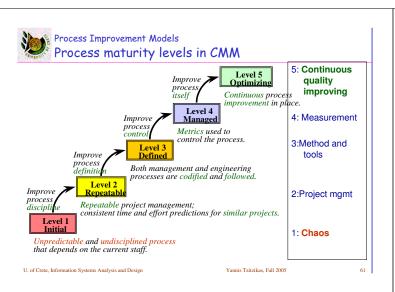

SEI (Software Engineering Institute), U. of Carnegie Mellon

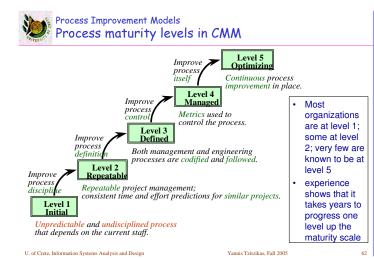

U. of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

U. of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

- For CMM level 2 an organization must provide positive answers to all these questions (and more)
 - Does the software quality assurance function have a management reporting channel separate from the software development project mgmt?
 - Is there a software configuration control function for each project that involves software development?
 - Is a formal process used in the management review of each software development prior to main contractual commitments?
 - Is a formal procedure used to produce software development schedules
 - Are formal procedures applied to estimate software development cost?
 - Are statistics on software code and test errors gathered ?
 - Does senior management have a mechanism for the regular review of the status of software development projects?
 - $\,-\,$ Is a mechanism for controlling changes to the software requirements ?

U. of Crete, Information Systems Analysis and Design

nnis Tzitzikas, Fall 2005

Vannis Tzitzikas Fall 2005

WIVERS OF

CMM level and some statistics (for a project of 200K lines of code)

Organization's	Project	Project	Number	Median
CMM	duration	person	of	Cost
Level	(months)	months	Defects	
1	30	600	61	5.5 M \$
2	18	153	12	1 M \$
3	15	80	7	0.5 M\$

U. of Crete, Information Systems Analysis and Design

Yannis Tzitzikas, Fall 2005

Process Improvement Models ISO 9000 family of quality standards

- ISO: International Organization for Standardization
- The ISO standards
 - apply to the quality management and the process to produce a quality product
 - apply to any industry and all types of businesses, including software development
- · The main premise
 - if the **process** is right then the process outcome (product or service) will also be right
 - but the ISO standards do not enforce specific processes -> the standards provide models of what must be accomplished, not how activities must be performed
