

UML: Introduction and Overview

How UML came up?
Overview of the UML Techniques and their uses
Why do analysis and design using UML ?
Hello World! in UML

Lecture : 3b
Date : 4-10-2005

Yannis Tzitzikas
University of Crete, Fall 2005

How we got here?

- 1980: C++
 - Need to adapt the design methods of ('70s-'80s) for the object-oriented world
- 1989-91 "Recursive Design Approach" (Sally Shlaew, Steve Meller)
- P. Coad and Ed. Yourdon (books 1991, 1991b, 1995,1999)
- Responsibility-Driven Design (Wirfs-Brock 90)
- Class-Responsibility-Collaboration (CRC Cards) Beck and Cunningham
- Grady Booch: work with Rational Software (for Ada systems)
- Jim Rumbaugh: Object-Modeling Technique (OMT)
- The most conceptual of these books: Martin and Odell, 94
- Ivar Jacobson (introduced the concept of use cases)
- Δεν υπήρχε διάθεση για τυποποίηση (standardization)
 - Κάθε ένας χρησιμοποιούσε τους δικούς του συμβολισμούς και μεθοδολογία

Famous joke:

- What is the difference between a methodologist and a terrorist?
- You can negotiate with a terrorist!

The birth of UML

- Jim Rumbaugh and G. Booch => Rational Software
- 1996: The 3 amigos (James Rumbaugh, Grady Booch, Ivar Jacobson)
 - **UML Version 1.1 Became OMG standard**
- Current version: **UML Version 2.0, 2003**

The objective of UML

To provide a common vocabulary of object-oriented terms and diagramming techniques that is rich enough to model any systems development project from analysis through implementation

How many UML diagrams exist?

- UML 2.0 defines 14 diagrammatic techniques used to model a system.
- Diagrams for modeling the structure of a system
 - Class, Object, Package, Deployment, Component, Composite Structure
- Diagrams for modeling the behavior of a system
 - Activity, Sequence, Communication, Interaction Overview, Timing, State, Protocol State Machine, Use Case Diagrams

When we use what diagram?

- Different diagrams are appropriate for different phases of the project
- Some diagrams can be used in more than one phase. They start from a very very abstract (and conceptual) form and evolve to include details that can even lead to code generation.

Notations and Meta-Models (αυστηρότητα έναντι ευχρηστίας)

- UML: defines a notation and a meta-model
 - Notation: graphical stuff we see in models, i.e. syntax
- Question: What exactly is meant by each one symbol ?
 - i.e. what is a **class**, what is a **multiplicity** ?
- **There is not a formal interpretation.**
- Formal interpretations can be found in the area of formal methods
 - where design and specifications are represented using derivatives of predicate calculus

Why not natural language?

Too imprecise and gets tangled when comes to more complex concepts

Why not formal methods?

Even if we can prove that a program satisfies a mathematical specification, there is no way to prove that the mathematical specification actually meets the real requirements of the system.

Other problems of formal methods:

- Often lead to getting bogged down (βαλτώνω) in lots of minor details
- Hard to understand and manipulate
 - often harder to deal with that programming languages
 - **and you can't even execute them!**

Why diagrams ?

```

create table Component (
  C_P_ID int primary key (ID_Comp),
  ID_Pro char(10) not null,
  ID_Par char(10) not null,
  Title char(1) not null,
  Quantity char(1) not null,
  constraint ID_Component primary key (ID_Comp, ID_Pro, ID_Par),
  constraint ID_Pro foreign key (ID_Pro) references Project,
  constraint ID_Par foreign key (ID_Par) references Part,
  constraint ID_Comp foreign key (ID_Comp) references Component
);

create table Department (
  ID_Dep char(10) not null,
  DeptID char(1) not null,
  DepName char(1) not null,
  Address char(1) not null,
  constraint ID_Dep primary key (ID_Dep),
  constraint ID_DeptID foreign key (ID_DeptID) references Department,
  constraint ID_DepName foreign key (ID_DepName) references Department,
  constraint ID_DepAddress foreign key (ID_DepAddress) references Department
);

create table Employee (
  EmpID char(10) not null,
  EmpName char(1) not null,
  EmpAddress char(1) not null,
  EmpStatus char(1) not null,
  EmpYear char(1) not null,
  constraint ID_Emp primary key (ID_Emp),
  constraint ID_EmpName foreign key (ID_EmpName) references Employee,
  constraint ID_EmpAddress foreign key (ID_EmpAddress) references Employee,
  constraint ID_EmpStatus foreign key (ID_EmpStatus) references Employee,
  constraint ID_EmpYear foreign key (ID_EmpYear) references Employee
);

create table Supplier (
  SupID char(10) not null,
  SupName char(1) not null,
  SupAddress char(1) not null,
  SupStatus char(1) not null,
  SupYear char(1) not null,
  constraint ID_Sup primary key (ID_Sup),
  constraint ID_SupName foreign key (ID_SupName) references Supplier,
  constraint ID_SupAddress foreign key (ID_SupAddress) references Supplier,
  constraint ID_SupStatus foreign key (ID_SupStatus) references Supplier,
  constraint ID_SupYear foreign key (ID_SupYear) references Supplier
);

create table Project (
  ProjID char(1) not null,
  ProjName char(1) not null,
  ProjAddress char(1) not null,
  ProjStatus char(1) not null,
  ProjYear char(1) not null,
  constraint ID_Proj primary key (ID_Proj),
  constraint ID_ProjName foreign key (ID_ProjName) references Project,
  constraint ID_ProjAddress foreign key (ID_ProjAddress) references Project,
  constraint ID_ProjStatus foreign key (ID_ProjStatus) references Project,
  constraint ID_ProjYear foreign key (ID_ProjYear) references Project
);

create table Part (
  PartID char(1) not null,
  PartName char(1) not null,
  PartAddress char(1) not null,
  PartStatus char(1) not null,
  PartYear char(1) not null,
  constraint ID_Part primary key (ID_Part),
  constraint ID_PartName foreign key (ID_PartName) references Part,
  constraint ID_PartAddress foreign key (ID_PartAddress) references Part,
  constraint ID_PartStatus foreign key (ID_PartStatus) references Part,
  constraint ID_PartYear foreign key (ID_PartYear) references Part
);

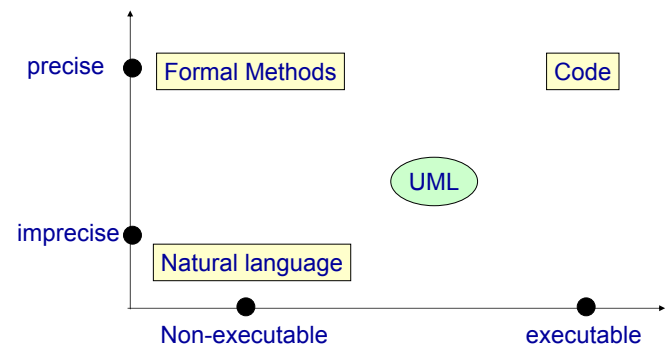

-- Constraints Section
alter table Component add constraint FKComp_Proj
  foreign key (ID_Pro) references Project;
alter table Component add constraint FKComp_Par
  foreign key (ID_Par) references Part;
alter table Component add constraint FKComp_Comp
  foreign key (ID_Comp) references Component;
alter table Department add constraint FKDept_Proj
  foreign key (ID_Pro) references Project;
alter table Department add constraint FKDept_Par
  foreign key (ID_Par) references Part;
alter table Department add constraint FKDept_Dept
  foreign key (ID_DeptID) references Department;
alter table Department add constraint FKDept_DeptName
  foreign key (ID_DepName) references Department;
alter table Department add constraint FKDept_DeptAddress
  foreign key (ID_DepAddress) references Department;
alter table Employee add constraint FKEmp_Proj
  foreign key (ID_Pro) references Project;
alter table Employee add constraint FKEmp_Par
  foreign key (ID_Par) references Part;
alter table Employee add constraint FKEmp_Emp
  foreign key (ID_Emp) references Employee;
alter table Employee add constraint FKEmp_EmpName
  foreign key (ID_EmpName) references Employee;
alter table Employee add constraint FKEmp_EmpAddress
  foreign key (ID_EmpAddress) references Employee;
alter table Employee add constraint FKEmp_EmpStatus
  foreign key (ID_EmpStatus) references Employee;
alter table Employee add constraint FKEmp_EmpYear
  foreign key (ID_EmpYear) references Employee;
alter table Supplier add constraint FKSup_Proj
  foreign key (ID_Pro) references Project;
alter table Supplier add constraint FKSup_Par
  foreign key (ID_Par) references Part;
alter table Supplier add constraint FKSup_Sup
  foreign key (ID_Sup) references Supplier;
alter table Supplier add constraint FKSup_SupName
  foreign key (ID_SupName) references Supplier;
alter table Supplier add constraint FKSup_SupAddress
  foreign key (ID_SupAddress) references Supplier;
alter table Supplier add constraint FKSup_SupStatus
  foreign key (ID_SupStatus) references Supplier;
alter table Supplier add constraint FKSup_SupYear
  foreign key (ID_SupYear) references Supplier;
alter table Project add constraint FKProj_Proj
  foreign key (ID_Proj) references Project;
alter table Project add constraint FKProj_Par
  foreign key (ID_Par) references Part;
alter table Project add constraint FKProj_ProjName
  foreign key (ID_ProjName) references Project;
alter table Project add constraint FKProj_ProjAddress
  foreign key (ID_ProjAddress) references Project;
alter table Project add constraint FKProj_ProjStatus
  foreign key (ID_ProjStatus) references Project;
alter table Project add constraint FKProj_ProjYear
  foreign key (ID_ProjYear) references Project;
alter table Part add constraint FKPart_Proj
  foreign key (ID_Pro) references Project;
alter table Part add constraint FKPart_Par
  foreign key (ID_Par) references Part;
alter table Part add constraint FKPart_PartName
  foreign key (ID_PartName) references Part;
alter table Part add constraint FKPart_PartAddress
  foreign key (ID_PartAddress) references Part;
alter table Part add constraint FKPart_PartStatus
  foreign key (ID_PartStatus) references Part;
alter table Part add constraint FKPart_PartYear
  foreign key (ID_PartYear) references Part;

```

A picture is worth a thousands of words

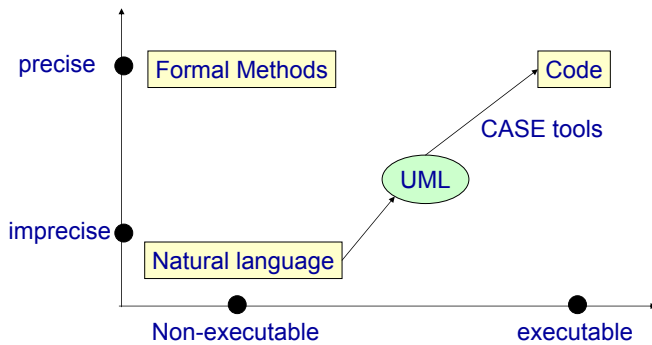

Overall picture

Most OO methods have very little rigor

- Their notation appeals to intuition rather than formal definition
- This does not seem to have done much harm. These methods may be informal, but many people still find them useful - and it is usefulness that counts.
- However, OO people are looking for ways to improve the rigor of methods without sacrificing their usefulness
 - one way: to define a meta-model: a diagram, usually a class diagram, that defines the notation

How strictly should you stick to the modeling language?

- Depends on the purpose
 - in case you use a CASE tool that generates code, you have to stick to the CASE tool's interpretation of the modeling language in order to get acceptable code
 - in case you use the diagrams for communication purposes, you have a little more leeway

List of UML Diagrammatic techniques and their uses

- **Use Case Diagram** (διάγραμμα περιπτώσεων χρήσης)
- **Class Diagram** (διάγραμμα κλάσεων)
- **Interaction Diagram** (διάγραμμα αλληλεπίδρασης)
 - Sequence Diagrams (διαγράμματα ακολουθίας)
 - Collaboration Diagrams (διαγράμματα συνεργασίας)
- **State Diagram** (διάγραμμα καταστάσεων)
- **Activity Diagram** (διαγράμματα δραστηριοτήτων)
- **Deployment Diagram** (διαγράμματα ανάπτυξης)
- **Package Diagram** (διάγραμμα πακέτων)
- **Component Diagram** (διάγραμμα εξαρτημάτων)

Use Cases

- **Use Case** = a set of scenarios tied together by a common user goal
- **Scenario** = a sequence of steps describing an interaction (user vs system)

Buy a Product

1. Customer browses through catalog and selects items to buy
2. Customer goes to check out
3. Customer fills in shipping information (address, next-day or 3-day delivery)
4. System presents full pricing information, including shipping
5. Customer fills in credit card information
6. System authorizes purchase
7. System confirms sale immediately
8. System sends confirming email to customer

Alternative: Authorization Failure

At step 6, system fails to authorize credit purchase

Allow customer to re-enter credit card information and re-try

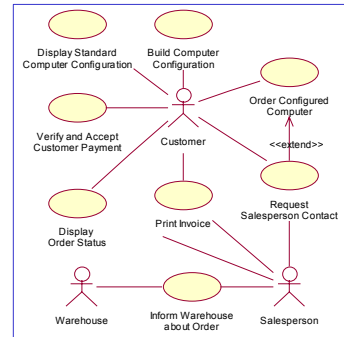

UML Techniques

Use Case Diagrams (διαγρ. περιπτώσεων χρήσης)

Elicits requirements from users in meaningful chunks. Construction planning is build around delivering some use cases in each iteration. Basis for system testing.

Used for: **Analysis**
Concerns: **Behavior**

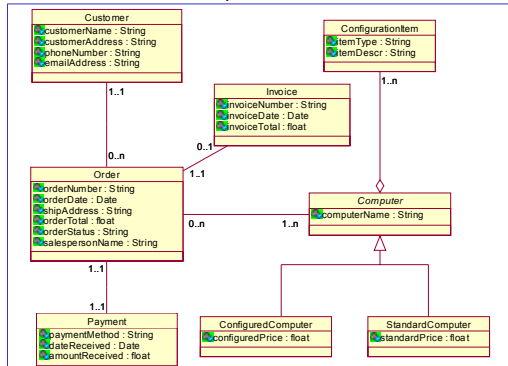

UML Techniques

Class Diagrams (διαγράμματα κλάσεων)

Used for: **Analysis/Design**
Concerns: **Structure**

Shows static structure of concepts, types, and classes. *Concepts* show how users think about the world; *types* show interfaces of software components; *classes* show implementation of software components

UML Techniques

Object Diagrams (διαγράμματα αντικειμένων)

Used for: **Analysis/Design**
Concerns: **Structure**

Shows the relationships between the objects in the system.

Class diagram

Object diagram

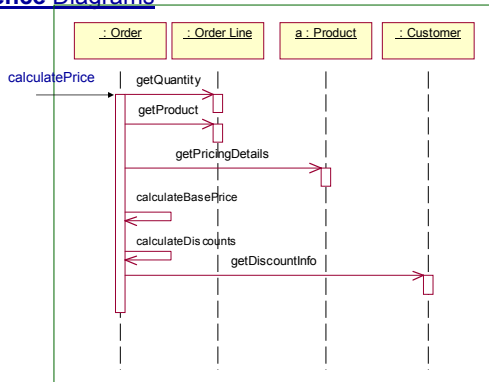

UML Techniques

Interaction Diagrams (διαγρ. αλληλεπίδρασης)

Used for: **Analysis/Design**
Concerns: **Behavior**

Show how several objects collaborate in a single use case

(A) Sequence Diagrams

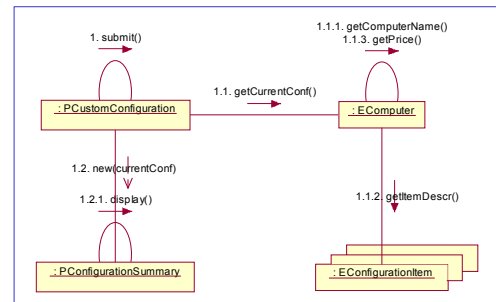

UML Techniques

Interaction

Used for: **Analysis/Design**
Concerns: **Behavior**

Show how several objects collaborate in a single use case

(B) Collaboration Diagrams

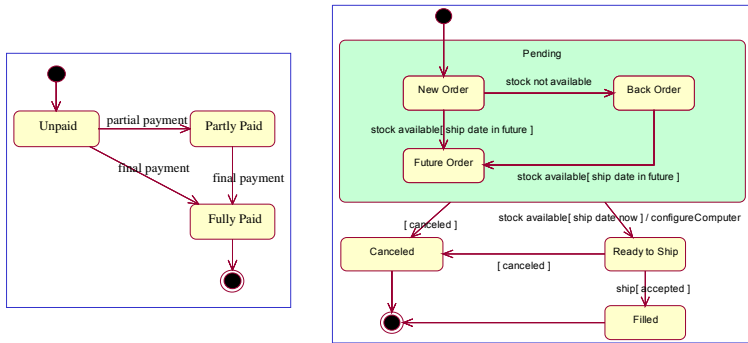

UML Techniques State Diagrams (διαγρ. καταστάσεων)

Used for: **Analysis/Design**
Concerns: **Behavior**

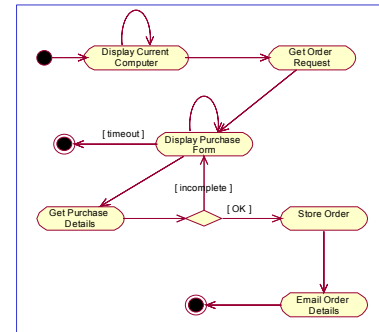

Shows how single object behaves across many use cases

UML Techniques Activity Diagrams (διαγρ. δραστηριοτήτων)

Used for: **Analysis/Design**
Concerns: **Behavior**

Illustrate business workflows independent of classes, the flow of activities in a use case, or detailed design of a method.

UML Techniques Package Diagrams (διαγρ. πακέτων)

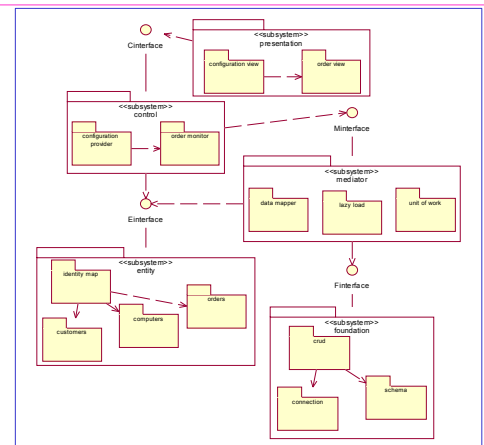

Used for: **Analysis/Design/Implement**
Concerns: **Structure**

Shows groups of classes and dependencies among them

It can also group other UML elements together

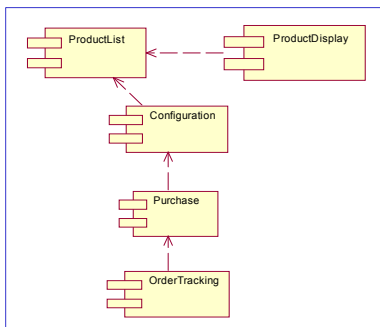

UML Techniques Package Diagrams

UML Techniques Component Diagrams (διαγρ. εξαρτημάτων)

Used for: **Phys./Design/Implement**
Concerns: **Structure**

- Component: a logical and replaceable part of a system that conforms to and provides the realization of a set of interfaces.

UML Techniques Component Diagrams (διαγρ. εξαρτημάτων)

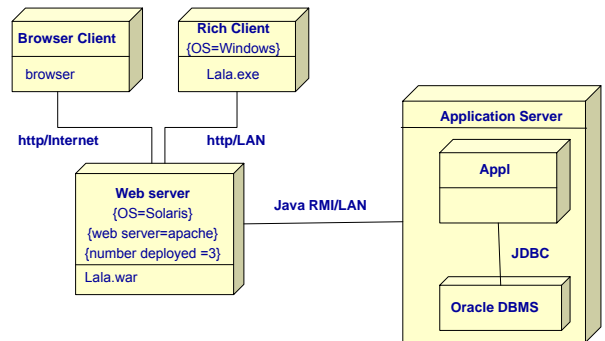

UML Techniques Deployment Diagrams (διαγρ. ανάπτυξης)

Used for: **Phys./Design/Implement**
Concerns: **Structure**

Shows physical layout of components on hardware nodes

UML Techniques Deployment Diagrams (διαγρ. ανάπτυξης)

Why do Analysis and Design using UML ?

- The real point of software development is executable code
 - diagrams are, after all, just pretty pictures
 - no user is going to thank you for pretty pictures; what a user wants is software that executes
- So we must ask ourselves
 - why we are using UML?
 - How it will help us when it comes down to writing the code ?
- Three main reasons
 - [A] Communication
 - [B] Learning OO
 - [C] Communication with Domain Experts

Why do Analysis and Design using UML ? [A] Communication

- Fundamental reason to use UML
 - Natural language
 - too imprecise and gets tangled when comes to more complex concepts
 - Code
 - precise but too detailed
- So we use UML when we want a certain amount of precision but don't want to get lost in details
 - this doesn't mean avoid details, but use UML to highlight important details.

Why do Analysis and Design using UML ? [A] Communication (II)

- Examples
 - You are a consultant to you want in a very short time to understand a big project
 - UML gives you an overall view of the system
 - class diagrams tell you what kinds of abstractions are used and where are the questionable parts (that need further work)
 - if you want a deeper view and see how classes collaborate, then you can see the interaction diagrams
 - You work for an organization as a system analyst/designer. You express your analysis and design using UML and then another company undertake the implementation.
- For the same reasons it is useful for the members of a project team
 - members have a common view (axon of reference)
 - new members enter the game quickly
 - less risk for the team if a person leaves the project

Why do Analysis and Design using UML ? [B] Learning OO

- It takes time to learn and use well OO
 - CRC cards is a very useful technique to learn OO (not part of UML)
 - Interaction diagrams
 - make the message structure explicit and thus are useful for highlighting over-centralized designs
 - Class diagrams
 - quite similar to data models
 - danger: develop a class model that is data oriented rather than being responsibility oriented
 - Patterns:
 - gets you concentrate on good OO designs and to learn by following an example

Why do Analysis and Design using UML ? [C] Communication with Domain Experts

- Use Cases:
 - US: a snapshot of one aspect of your system
 - The sum of all Use Cases: the external picture of your system
 - Very good tool to understand what users want
- Class diagrams
 - Help, especially those built from a “conceptual perspective”
- Activity diagrams
 - Useful if workflow processes are an important part of the user’s world
 - as they support parallel processes, can help you get away from unnecessary sequences

Hello World! in UML

mypage.html

```
<html>
<body>
<APPLET CODE="HelloWorld.class">
</APPLET>
</body>
</html>
```

HelloWorld.java

```
import java.applet.Applet;
import java.awt.Graphics;

public class HelloWorld extends Applet {
    public void paint(Graphics g) {
        g.drawString("Hello world!", 50, 25);
    }
}
```

Hello World! in UML

```
import java.applet.Applet;
import java.awt.Graphics;
```

```
public class HelloWorld extends Applet {
    public void paint(Graphics g) {
        g.drawString("Hello world!", 50, 25);
    }
}
```

Hello World! in UML

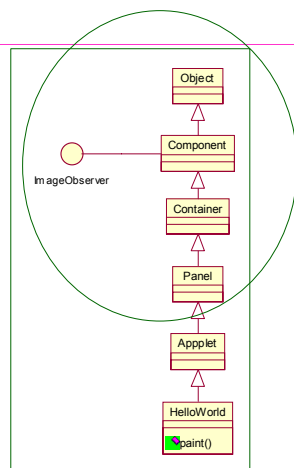

```
import java.applet.Applet;
import java.awt.Graphics;
```

```
public class HelloWorld extends Applet {
    public void paint(Graphics g) {
        g.drawString("Hello world!", 50, 25);
    }
}
```

Hello World! in UML

By studying the Java libraries for Applet and Graphics the **entire hierarchy** is revealed:

Hello World! in UML

By studying how the Java libraries are **organized (packaged)**:

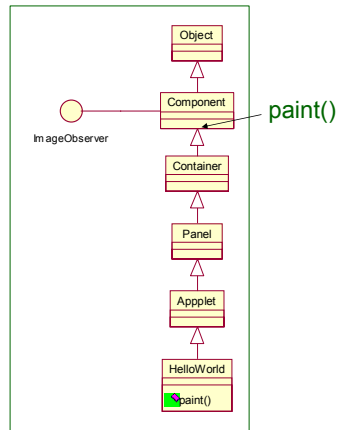

Hello World! in UML

How Java classes work together?

How the **paint** operation gets invoked ?

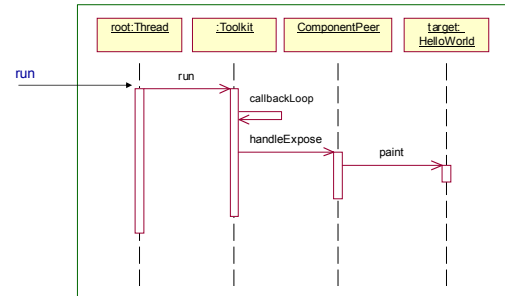

By studying Java libraries we see that **paint** is inherited from **component**

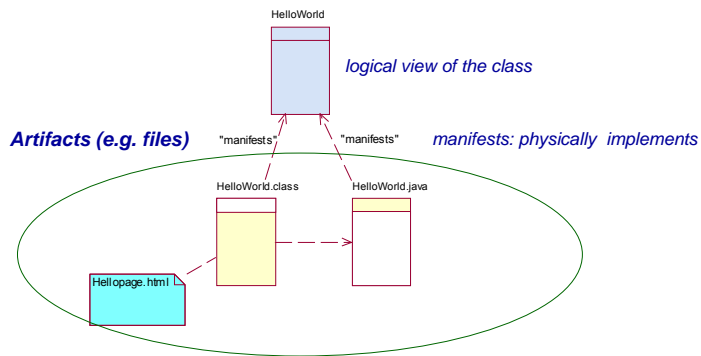

Hello World! in UML

By studying how Java classes work together we see that **paint** is invoked as follows:

paint is called as part of the **thread that encloses applet**.

Hello World! in UML: Physical view
