

Physical (or Implementation) Diagrams

- UML component diagrams 
- UML deployment diagrams 

Lecture : (18b) or 19
Date : 20-12-2005

Yannis Tzitzikas
University of Crete, Fall 2005

Outline

- Component Diagrams
- Deployment Diagrams
- Combining Component & Deployment Diagrams

Key questions

Computing platform comprises hardware, software (PLs, DBMSs) and networking.

- Which platform is best suited for this information system?
- How to select hardware ?
- How to select software ?
- How to select networking?
- How to express the physical architecture (see Lecture 18) of the system using a standard diagrammatic notation?

Component Diagrams

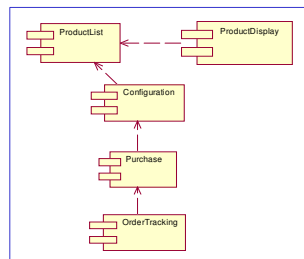

Component Diagrams (διαγράμματα εξαρτημάτων)

Component Diagrams show various components and their dependencies

- **Component:**
 - physical module of code (like package, class, or even file)
- **dependence:**
 - change dependency (e.g. communication dependencies, compilation dependencies)

Notations :

The Characteristics of a Component

- a unit of independent deployment (never deployed partially)
- sufficiently documented and self-contained to be “plugged into” other components by a third-party
- it cannot be distinguished from copies of its own; in any given application, there will be at most one copy of a particular component
- it is a replaceable part of a system (can be replaced by another component that conforms to the same interface)
- it fulfils a clear function and is logically and physically cohesive
- it may be nested in other components
[Szyperki 98, Rumbaugh et al. 99, Maciaszek 2005)]

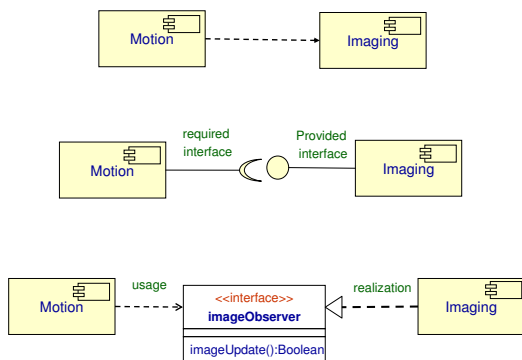

Components

- Components are like classes and packages
 - can be connected through interfaces
- Components are about how customers want to relate to software
 - they want to be able to upgrade it like they can upgrade their stereo (in pieces)
 - they want to mix and match pieces from various manufacturers
 - reasonable but difficult to satisfy
- So we could define a component as:
 - a logical and replaceable part of a system that conforms to and provides the realization of a set of interfaces
 - an independently purchasable and upgradeable piece of software

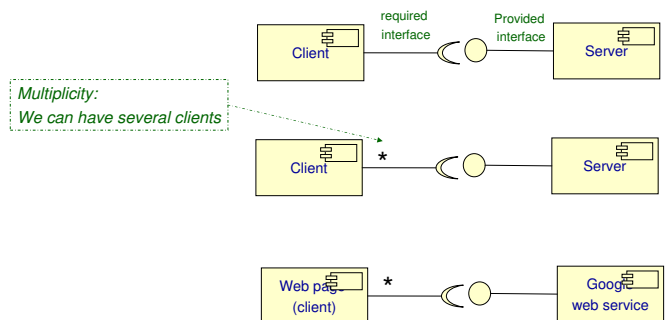

Components and related Notions

- **Component**
 - a replaceable part of a system that conforms to and provides the realization of a set of interfaces
- **Interface:**
 - a collection of operations that specify a service that is provided by or requested from a class or component
- **Port**
 - a specific window into an encapsulated component accepting messages to and from the component conforming to specified interfaces
- **Part**
 - (an internal component) the specification of a role that composes part of the implementation of a component.
- **Internal structure**
 - the implementation of a component by means of a set of parts that are connected together in a specific way
- **Connector:**
 - a communication relationship between two parts or ports within the context of component

Components and interfaces

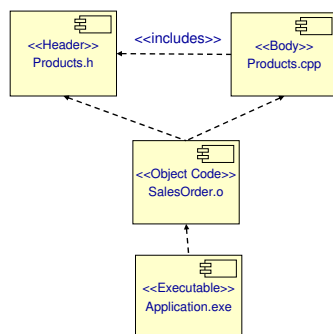

Components and interfaces (II)

Fine-grained Components: Example

We could use component diagrams for modeling more fine-grained components (e.g. files).

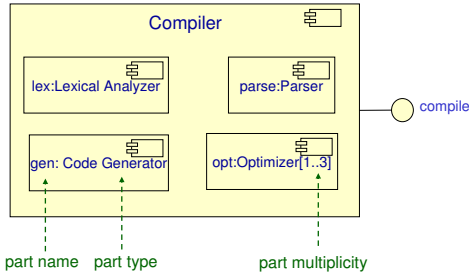

Coarse-grained components: e.g. Layers

Internal Structure of Components

Ports

- Ports permit the interfaces of a component to be divided into discrete packets and used independently
- The externally visible behaviour of the component is the sum of its ports.

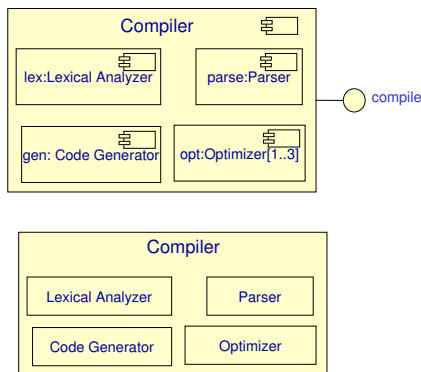

Connecting Components

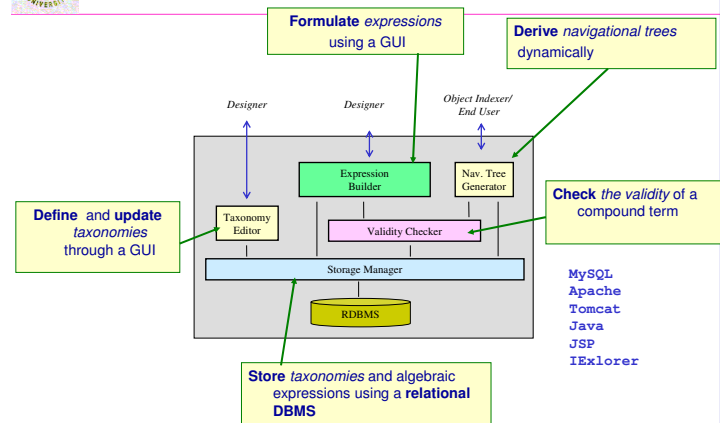

- Components can be connected by wiring together their **ports**
 - **connector**: a wire between two ports

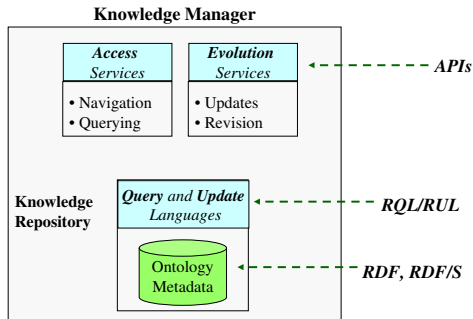

In practice, components diagrams are sometimes depicted in a less formal and more liberal graphical notation

RDF Suite Architecture

DOMENICUS Architecture

UML Deployment Diagrams

Deployment Diagrams (διαγράμματα ανάπτυξης/σύνταξης/παράθεσης)

Shows the physical relationship among software & hardware components in the delivered system

Node:

- computational unit (**hardware**)
 - e.g. PC, sensor, mainframe, mobile device

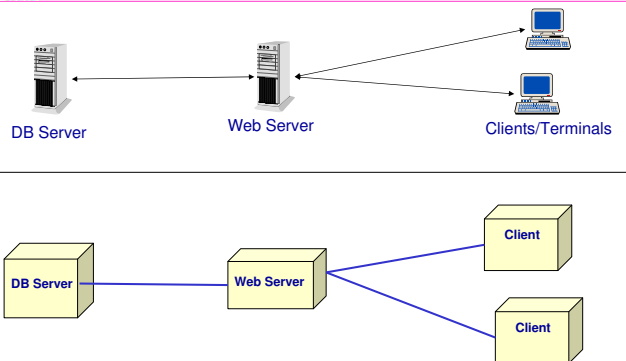

Connection (among nodes)

- communication paths over which the system will interact

A deployment diagram

Deployment Diagrams > Nodes

- Physical element (with memory and processor)
- With nodes we can model the topology of the hardware of a system

Deployment Diagrams > Connections

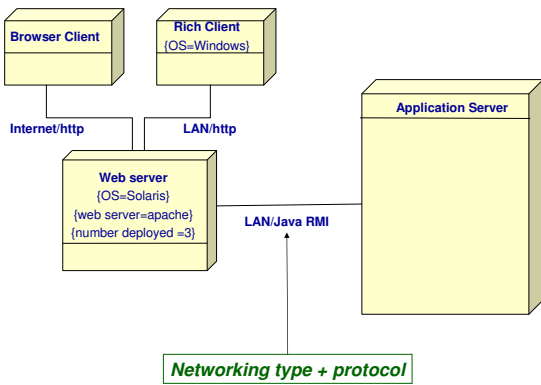

Connections

- Ethernet, serial line, satellite link
- we can use **stereotypes** to distinguish them to types
 - <<serial line>>
 - <<satellite link>>
 - ...

Deployment Diagrams > Connections

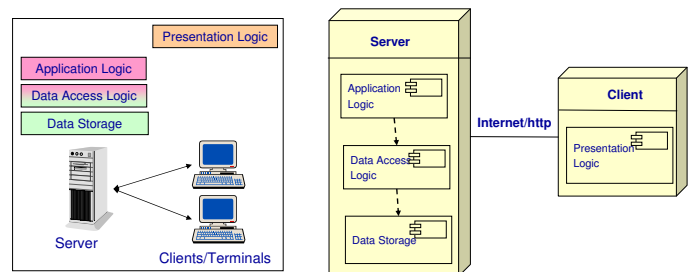

Modeling the Distribution of Artifacts

Combining Component and Deployment Diagrams

Combining Component and Deployment Diagrams: Example

Combining Component and Deployment Diagrams: Notes

- If we try to show all the components of a system in deployment diagrams they will probably become very large and difficult to read.
- So we usually depict the key elements
- Alternatively, (in case we want to show everything) we can use a table to denote artifacts and their locations (e.g. use Excel)

Hardware and Software Specification

- We have to specify the new hardware or software that must be purchased
- Actual acquisition of hardware and software usually left to a purchasing department -- especially in larger firms

Realities in Infrastructure Design

- Most often the infrastructure will be already in place
- Coordination of infrastructure components is very complex
 - The application developer will need to coordinate with infrastructure specialists

Steps in Hardware and Software Specification

- Note hardware in low-level network model to create list of needed hardware
- Describe equipment in as much detail as possible
- Consider whether increased processing and traffic will absorb unused hardware capacity
- Note all software running on each hardware component

Hardware

- **Commercial/Business**
 - Mainframes, Commercial Minicomputers, Microcomputers (Wintel: Windows on Intel), Embedded Systems
- **Technical/Engineering**
 - Supercomputers, Workstations and Servers (Sun SPARC), Microcomputers, Embedded Systems

Some distinctions:

- **Open vs Proprietary**
 - Proprietary: available by only one vendor (higher prices, low interoperability)
 - Open: available from many vendors (better prices, better interoperability)
- **Black-Box vs Glass-Box**
 - Black-box: only the vendor has access to its internals (e.g. bank ATM)
 - Glass Box: internals are accessible by the user, may replaceable by other vendor
 - Free UNIX derivatives (Linux, BSD) on Intel x86 with source code are glass-box systems

Networking

- **Local Area Network**
 - short-distance (one building)
- **Backbone**
 - medium distance (campus)
- **Wide Area Network**
 - long-distance
- **Remote Access**
 - via phone / cable TV/satellite

Networking

LAN	Backbone Network	WAN
<ul style="list-style-type: none"> • Ethernet <ul style="list-style-type: none"> – 10/100 Mb (1Gb fibre) – Inexpensive, widely used • Token Ring <ul style="list-style-type: none"> – 4/16 Mb – Not often used • ATM (copper) <ul style="list-style-type: none"> – 155 Mb (622Mb fibre) – Expensive, complex, flexible, high-overhead 	<ul style="list-style-type: none"> • 100 Mb (fibre) or Gb Ethernet <ul style="list-style-type: none"> – fast, inexpensive, simple • FDDI <ul style="list-style-type: none"> – Old 100 Mbit (increasingly obsolete) • ATM <ul style="list-style-type: none"> – 155 Mb, 622 MB 	<ul style="list-style-type: none"> • Long-distance line leased from telephone companies • Satellite links sometimes used

Remote Access

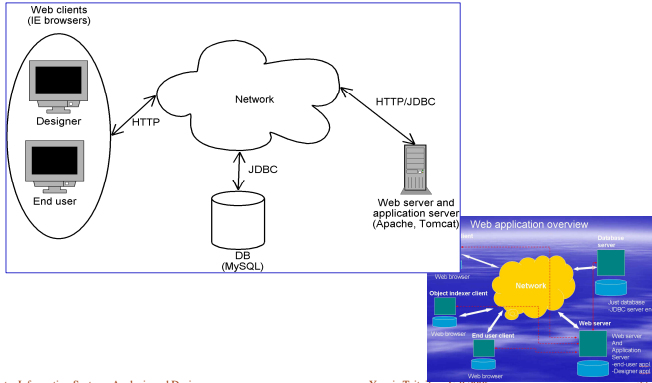

- Accessing a LAN or internet via phone/cable TV service
 - work from home, access when travelling, home internet service
 - Usually PPP over modem or cable modem
- DSL services

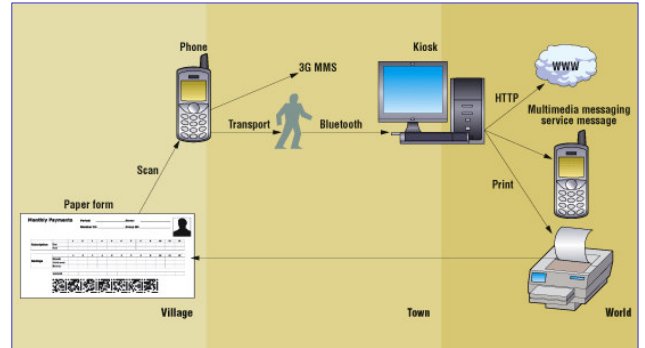

Deployment diagrams are usually depicted in a less formal and more liberal /vivid graphical notation
