Presentation for use with the textbook, Algorithm Design and Applications, by M. T. Goodrich and R. Tamassia, Wiley, 2015

## Numerical Algorithms

| $\boldsymbol{x}$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $x^{-1}$ |  | 1 |  | 7 |  |  |  | 3 |  | 9 |

## Outline

- Divisibility and primes
- Modular arithmetic

Euclid' s GCD algorithm

- Multiplicative inverses
- Powers
*Fermat' s little theorem
*Euler's theorem

## Facts About Numbers

- Prime number $p$ :
- $p$ is an integer
- $p \geq 2$
- The only divisors of $p$ are 1and $p$
- Examples
- 2, 7, 19 are primes
- -3, 1, 6 are not primes
- Prime decomposition of a positive integer $n$ :

$$
\boldsymbol{n}=\boldsymbol{p}_{1} \boldsymbol{e}_{1} \times \ldots \times \boldsymbol{p}_{\boldsymbol{k}}^{\boldsymbol{e}_{k}}
$$

$\bullet$ Example:

- $200=2^{3} \times 5^{2}$

Fundamental Theorem of Arithmetic
The prime decomposition of a positive integer is unique

## Greatest Common Divisor

- The greatest common divisor (GCD) of two positive integers $\boldsymbol{a}$ and $\boldsymbol{b}$, denoted $\operatorname{gcd}(\boldsymbol{a}, \boldsymbol{b})$, is the largest positive integer that divides both $a$ and $b$
- The above definition is extended to arbitrary integers
- Examples:

$$
\operatorname{gcd}(18,30)=6 \quad \operatorname{gcd}(0,20)=20
$$

$$
\operatorname{gcd}(-21,49)=7
$$

- Two integers $a$ and $b$ are said to be relatively prime if

$$
\operatorname{gcd}(\boldsymbol{a}, \boldsymbol{b})=1
$$

- Example:
- Integers 15 and 28 are relatively prime

## Modular Arithmetic

- Modulo operator for a positive integer $n$

$$
\boldsymbol{r}=\boldsymbol{a} \bmod \boldsymbol{n}
$$

equivalent to

$$
a=r+k n
$$

and

$$
r=a-\lfloor a / n\rfloor n
$$

- Example:

$$
\begin{array}{lll}
29 \bmod 13=3 & 13 \bmod 13=0 & -1 \bmod 13=12 \\
29=3+2 \times 13 & 13=0+1 \times 13 & 12=-1+1 \times 13
\end{array}
$$

- Modulo and GCD:

$$
\operatorname{gcd}(\boldsymbol{a}, \boldsymbol{b})=\operatorname{gcd}(\boldsymbol{b}, \boldsymbol{a} \bmod \boldsymbol{b})
$$

- Example:

$$
\operatorname{gcd}(21,12)=3 \quad \operatorname{gcd}(12,21 \bmod 12)=\operatorname{gcd}(6,9)=3
$$

## Euclid's GCD Algorithm

- Euclid's algorithm for computing the GCD repeatedly applies the formula

$$
\operatorname{gcd}(\boldsymbol{a}, \boldsymbol{b})=\operatorname{gcd}(\boldsymbol{b}, \boldsymbol{a} \bmod \boldsymbol{b})
$$

* Example
- $\operatorname{gcd}(412,260)=4$

```
Algorithm EuclidGCD (a, b)
    Input integers \(\boldsymbol{a}\) and \(\boldsymbol{b}\)
    Output \(\operatorname{gcd}(\boldsymbol{a}, \boldsymbol{b})\)
    if \(b=0\)
        return \(a\)
    else
        return EuclidGCD \((b, a \bmod b)\)
```

| $\boldsymbol{a}$ | 412 | 260 | 152 | 108 | 44 | 20 | 4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{b}$ | 260 | 152 | 108 | 44 | 20 | 4 | 0 |

## Analysis

Let $a_{i}$ and $b_{i}$ be the arguments of the $i$-th recursive call of algorithm EuclidGCD

- We have

$$
a_{i+2}=b_{i+1}=a_{i} \bmod a_{i+1}<a_{i+1}
$$

- Sequence $a_{1}, a_{2}, \ldots, a_{n}$ decreases exponentially, namely

$$
a_{i+2} \leq 1 / 2 a_{i} \text { for } i>1
$$

Case $1 a_{i+1} \leq 1 / 2 a_{i} \quad a_{i+2}<a_{i+1} \leq 1 / 2 a_{i}$
Case $2 a_{i+1}>1 / 2 a_{i} \quad a_{i+2}=a_{i} \bmod a_{i+1}=a_{i}-a_{i+1} \leq 1 / 2 a_{i}$

- Thus, the maximum number of recursive calls of algorithm EuclidGCD (a.b) is

$$
1+2 \log \max (\boldsymbol{a} \cdot \boldsymbol{b})
$$

Algorithm EuclidGCD(a,b) executes $\boldsymbol{O}(\log \max (\boldsymbol{a}, \boldsymbol{b}))$ arithmetic operations

## Multiplicative Inverses (1)

- The residues modulo a positive integer $\boldsymbol{n}$ are the set

$$
Z_{n}=\{0,1,2, \ldots,(n-1)\}
$$

Let $x$ and $y$ be two elements of $Z_{n}$ such that

$$
x y \bmod n=1
$$

We say that $y$ is the multiplicative inverse of $x$ in $Z_{n}$ and we write $\boldsymbol{y}=\boldsymbol{x}^{-1}$

- Example:
- Multiplicative inverses of the residues modulo 11

| $x$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $x^{-1}$ |  | 1 | 6 | 4 | 3 | 9 | 2 | 8 | 7 | 5 | 10 |

## Multiplicative Inverses (2)

## Theorem

An element $x$ of $Z_{n}$ has a multiplicative inverse if and only if $x$ and $n$ are relatively prime

- Example
- The elements of $\boldsymbol{Z}_{10}$ with a multiplicative inverse are $1,3,5,7$

Corollary
If is $p$ is prime, every nonzero residue in $Z_{p}$ has a multiplicative inverse
Theorem
A variation of Euclid' s GCD algorithm computes the multiplicative inverse of an element $x$ of $Z_{n}$ or determines that it does not exist

| $x$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $x^{-1}$ |  | 1 |  | 7 |  |  |  | 3 |  | 9 |

## Powers

- Let $p$ be a prime
- The sequences of successive powers of the elements of $Z_{p}$ exhibit repeating subsequences
- The sizes of the repeating subsequences and the number of their repetitions are the divisors of $p-1$
- Example ( $\boldsymbol{p}=7$ )

| $\boldsymbol{x}$ | $\boldsymbol{x}^{2}$ | $\boldsymbol{x}^{3}$ | $\boldsymbol{x}^{4}$ | $\boldsymbol{x}^{5}$ | $\boldsymbol{x}^{6}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 1 | 1 | 1 | 1 |
| 2 | 4 | 1 | 2 | 4 | 1 |
| 3 | 2 | 6 | 4 | 5 | 1 |
| 4 | 2 | 1 | 4 | 2 | 1 |
| 5 | 4 | 6 | 2 | 3 | 1 |
| 6 | 1 | 6 | 1 | 6 | 1 |

## Fermat' s Little Theorem

Theorem
Let $p$ be a prime. For each nonzero residue $x$ of $Z_{p}$, we have $x^{p-1} \bmod p=1$

- Example $(p=5)$ :
$1^{4} \mathrm{mod}$
$3^{4} \bmod$
rollary
Let $p$ be a prime. For each nonzero residue $x$ of $Z_{p}$, the multiplicative inverse of $x$ is $x^{p-2} \bmod p$ Proof

$$
\boldsymbol{x}\left(\boldsymbol{x}^{p-2} \bmod \boldsymbol{p}\right) \bmod \boldsymbol{p}=\boldsymbol{x} \boldsymbol{x}^{p-2} \bmod \boldsymbol{p}=\boldsymbol{x}^{p-1} \bmod \boldsymbol{p}=1
$$

## Euler's Theorem

- The multiplicative group for $Z_{n^{\prime}}$ denoted with $Z^{*}{ }_{n}$, is the subset of elements of $Z_{n}$ relatively prime with $n$
- The totient function of $n$, denoted with $\phi(n)$, is the size of $Z^{*}{ }_{n}$
- Example

$$
Z^{*}{ }_{10}=\{1,3,7,9\} \quad \phi(10)=4
$$

- If $p$ is prime, we have

$$
Z_{p}^{*}=\{1,2, \ldots,(p-1)\} \quad \phi(p)=p-1
$$

## Theorem

For each element $x$ of $Z^{*}{ }_{n}$, we have $x^{\phi(n)} \bmod n=1$

- Example ( $n=10$ )

$$
\begin{aligned}
& 3^{\phi(10)} \bmod 10=3^{4} \bmod 10=81 \bmod 10=1 \\
& 7 \phi(10) \bmod 10=7^{4} \bmod 10=2401 \bmod 10=1 \\
& 9 \phi(10) \bmod 10=9^{4} \bmod 10=6561 \bmod 10=1
\end{aligned}
$$
