IEEE 802.11 standards

	<i>802.11b</i>	<i>802.11a</i>	<i>802.11g</i>
Standard approved	July 1999	July 1999	June 2003
Maximum data rate	11 Mbps	54 Mbps	54 Mbps
Modulation	CCK	OFDM	OFDM and CCK
Data rates	1, 2, 5.5, 11 Mbps	6, 9, 12, 18, 24, 36, 48, 54 Mbps	CCK: 1, 2, 5.5, 11 OFDM: 6, 9, 12, 18, 24, 36, 48, 54 Mbps
Frequencies	2.4–2.497 GHz	5.15–5.35 GHz 5.425–5.675 GHz 5.725–5.875 GHz	2.4–2.497 GHz

802.11 stands here:

802.11 a/b/g/n/ac/... define

- MAC sublayer
 - access mechanisms, fragmentation, encryption
- MAC Management
 - roaming, MIB, power management
- PLCP sublayer
 - clear channel assessment signal (carrier sense)
- PMD sublayer
 - modulation, coding
- PHY Management
 - channel selection, Management Information Base(MIB)
- Station Management
 - coordination of all management functions

 - ONOE

ARF

Auto Rate Fall-back (ARF)

- Start data transmission at the highest bit-rate.
- If f consecutive packet transmissions fail at the current bit-rate, set the current rate to the next lower bit-rate.
- If s consecutive packet transmissions succeed at the current bit-rate, set the current rate to the next higher bit-rate.
- Otherwise continue at the same bit-rate.

In the current implementations of ARF $s = 10$, $f = 2$.

AARF

Implements a binary-exponential back-off procedure.

- Transmits a probe packet at the next higher bit-rate after encountering a (threshold number) of consecutive successful packet transmissions s at the current bit-rate.
- If the probe packet transmission fails, the number of consecutive successful packet transmissions required at the current bit-rate before the next probe packet is sent is doubled, up to a (maximum value)
- If the probe packet transmission is successful, the current bit-rate is set to the bit-rate at which the probe was sent.
- If f consecutive packet transmissions fail at the current bit-rate, set the current bit-rate to the next lower bit-rate.

In the current implementation s (initial) = 10, f = 2 and $s(\text{max})=50$.
