1 month ago

Motivation

- Hypothetical **attack** at a corporate infrastructure
- **Ransomware**: encryption to hold a victim's information at ransom
 - You need to pay to access your data
- Develop tools that will help study an attack

Execution Monitoring

Execution Monitoring

- Create a system that will **monitor** the behavior of an application (i.e. executable)
- You get an executable, you run it and report what it did
 - The tracee will be executed!
- **Need to:**
 - Compute hash value
 - Extract strings
 - **Monitor system calls**
 - Create report with detailed information
- **Running:**

```
$ ./monitor application.out
```

Tracing

- Use `ptrace()` to monitor system calls

PTRACE(2)

Linux Programmer's Manual

PTRACE(2)

NAME [top](#)

`ptrace` - process trace

SYNOPSIS [top](#)

```
#include <sys/ptrace.h>
```

```
long ptrace(enum __ptrace_request request, pid_t pid,  
            void *addr, void *data);
```

DESCRIPTION [top](#)

The `ptrace()` system call provides a means by which one process (the "tracer") may observe and control the execution of another process (the "tracee"), and examine and change the tracee's memory and registers. It is primarily used to implement breakpoint debugging and system call tracing.

Tracing

- **System calls:**
 - Programmatic way to request a service from the operating system
- **The tracee might be **stopped** at both the entry and the exit of system calls**
 - Need to carefully count calls
- **There are some system calls that are called when a program starts**
 - Not a bug

Implementation Details

- **Ptrace does not know system call **symbolic names****
 - Works with system call numbers
- **Need to map names to **numbers****
- **Important: System call numbers and their symbolic names may be different across architectures or kernel versions**
 - Your implementation should be compatible with CSD workstations!

Implementation Details

- **Deep inspection** for 3 system calls
 - sendto()
 - read()
 - write()
- **Read passed arguments**
 - Read registers
 - Read memory content

Depends on architecture!
- **Not exhaustive tests. Don't care of other ways one can open a file**

Implementation

- **Need to examine content of files**

- What if they are **binary**?
- Not allowed to use the `strings` utility tool!

- **Need to **extract** all strings from file**

- String == Sequence of **printable** characters

Hash Generators

- **Need to compute the **hash** value of all files**
 - Acts like a fingerprint or file signature
- **Allowed to use **OpenSSL****
 - No need to reinvent the wheel
- **Read the docs!**
 - MD5, SHA256

Tracee

- You need to develop **your own test** applications
- You should **submit** enough tests to demonstrate the correct behavior of your system
- No need to create **complex** applications
 - But you need to test with a binary file

```
#!/bin/python3
import requests

with open("temp.txt", "w") as file:
    file.write("hy457")

requests.get(url="http://google.com")
```

Example

```
$ ./monitor ./pha.out
```

```
[INFO] [20-Mar-25 13:53:43] Application Started with argument 'pha.out'
[INFO] [20-Mar-25 13:53:43] MD5 hash:      7c1cadb6887373dacb595c47166bfbd9

[INFO] [20-Mar-25 13:53:53] Stored report to 'report.txt'
```

Network Traffic Analyzer

Network Traffic Analyzer

- Create a **packet analyzer** for network traffic
- Monitors network traffic, analyzes protocols and prints statistical information

Overview

Wireshark

Overview

```
$ analyze ./traffic.pcap 192.168.153.1
```

1. Read pcap file containing network traffic
2. Identify packets that match IP address
3. Collect information
4. Print statistics

Monitoring

- Use the **pcap** library to process **captured** traffic
 - No need to focus on real-time capture
 - You can test if you want (only on your personal workstation)

PCAP(3PCAP) MAN PAGE

Section: Misc. Reference Manual Pages (3PCAP)

Updated: 9 September 2020

[Index](#) [Return to Main Contents](#)

NAME

pcap - Packet Capture library

SYNOPSIS

```
#include <pcap/pcap.h>
```

DESCRIPTION

The Packet Capture library provides a high level interface to packet capture systems. All packets on the network, even those destined for other hosts, are accessible through this mechanism. It also supports saving captured packets to a "savefile", and reading packets from a "savefile".

Monitoring

- You need to **iterate** over packets
 - e.g. `pcap_loop()`
- You need to parse **protocol headers** to get IP addresses and ports
- The headers you need to parse are:
 - Ethernet
 - IP
 - TCP
 - UDP

Don't forget about encapsulation!

Implementation Details

You need to store:

- a. Source and destination IP addresses
- b. Source and destination Ports
- c. Type
- d. Packet length

IP Addresses

- Focus only on IPv4 addresses
- Dotted decimal notation
 - 192.168.1.1
- CIDR Notation
 - Network Prefix and Host Identifier
 - 192.168.1.0/24 is equivalent to 192.168.1.* or 192.168.1.0 - 255

Example

```
$ analyze ./traffic.pcap 192.168.153.1
```

```
[INFO] [20-Mar-25 14:12:27] Application Started with argument ` traffic.pcap`  
[INFO] [20-Mar-25 14:12:27] MD5 hash:      cd6bc10414b9d3fdb8fba52579f654ad  
[INFO] [20-Mar-25 14:12:28] SHA256 hash: 11760f811e5e82d293ac01.....  
[INFO] [20-Mar-25 14:12:28] Initialized data structures  
[INFO] [20-Mar-25 14:12:28] Filtering traffic of 192.168.153.1
```

```
IP: 142.162.123.43  
5 outgoing packets [15623 Bytes]  
Source Ports: 19981, 20010, 20024, 20034, 20036  
Destination Ports: 80  
Protocols: TCP
```

```
IP: 192.168.153.130  
40 outgoing packets [637193 Bytes]  
Source Ports: 3372, 19407, 19938  
Destination Ports: 20041, 20042, 20043  
Protocols: UDP, TCP
```

```
...
```

Secret Sharing

Motivation

- **Place important documents inside a “vault”**
 - Files inside the vault are encrypted and safe
- **No single individual can open the “vault” on their own**

Secret Sharing System

- Implement a **secret sharing** mechanism
 - In this case the secret would be the encryption key
 - No need to implement encryption
- Distribute a secret among a group so that the secret **cannot be revealed** unless X people are present

Overview

- Assume there are three friends: Alice, Bob and Carol
- The three people will **share** a secret number “c” by each taking a piece of the number
- Only when all three pieces are presented then all of them are able to reconstruct the secret number “c”

Introduction

- **How can we achieve this?**
 - Let's assume the secret we want to share is a Euclidean line
- **How many lines are there?**
 - Infinite
- **What defines a line?**
 - Two points
 - We need to know them to reconstruct the line
- **Can one person on their own reconstruct the line?**

https://en.wikipedia.org/wiki/Euclidean_plane

Euclidean Plane

$$y = 3x + 3$$

Simple Example

- Let's assume that Alice and Bob want to share the secret number **72**
 - Since they are 2, the polynomial degree is 1
- They **randomly** choose “a” to be 14 and “b” is the secret number
 - $f(x) = a \cdot x + b = 14 \cdot x + 72$
- They calculate $f(1) = 86$ and $f(2) = 100$
 - Alice gets (1, 86)
 - Bob gets (2, 100)

Simple Example

- To **reconstruct** the secret, they present their points and reconstruct the polynomial

$$\begin{array}{l} 86 = a + b \\ 100 = 2a + b \end{array} \left. \vphantom{\begin{array}{l} 86 = a + b \\ 100 = 2a + b \end{array}} \right\} \begin{array}{l} a = 86 - b \\ 100 = 2(86 - b) + b \end{array} \left. \vphantom{\begin{array}{l} a = 86 - b \\ 100 = 2(86 - b) + b \end{array}} \right\} \begin{array}{l} 100 = 172 - 2b + b \\ -72 = -b \end{array} \left. \vphantom{\begin{array}{l} 100 = 172 - 2b + b \\ -72 = -b \end{array}} \right\} b = 72$$

Implementation

- Secret Sharing achieved by constructing the polynomial
$$f(x) = a \cdot x^2 + b \cdot x + c$$
- Each person will take a point of the polynomial
 - Alice: $(1, f(1))$
 - Bob: $(2, f(2))$
 - Carol: $(3, f(3))$
- When all 3 points are presented, they reconstruct the polynomial to retrieve secret number “c”

Implementation Details

- Using the **split** option and a secret number the program generates the individual points
 - `$ ./vault split 9`
`> (1, 16), (2, 27), (3, 42)`
- Using the **join** option and the 3 points, the program reconstructs the secret number
 - `$ ./vault join (1, 16), (2, 27), (3, 42)`
`> 9`
- **Generalize your solution for N friends.**
 - When any three present their points they are able to reconstruct the secret

Implementation Details

- **Allowed to look up how to solve system of linear equations with three variables**
 - Our focus is not maths → Cramer is your friend
- **No need to create parser for unlock function**
 - Use any format you like and assume the input will always be correct
- **Feel free to generate random numbers any way you like**
 - `srand, rand`
 - `/dev/urandom`

Advanced Example

- Select a secret shared number “c”

- E.g. c is 9

- $f(x) = 2 \cdot x^2 + 5 \cdot x + 9$ where a, b were randomly generated

- When 3 shares (x_1, x_2, x_3) are present:

○ $f(x_1) = a \cdot x_1^2 + b \cdot x_1 + c$	$f(1) = 16$		$16 = a + b + c$	(1)
○ $f(x_2) = a \cdot x_2^2 + b \cdot x_2 + c$	$f(2) = 27$		$27 = 4 \cdot a + 2 \cdot b + c$	(2)
○ $f(x_3) = a \cdot x_3^2 + b \cdot x_3 + c$	$f(3) = 42$		$42 = 9 \cdot a + 3 \cdot b + c$	(3)

Advanced Example

$$\begin{array}{rcl} 16 & = & a + b + c \quad (1) \\ 27 & = & 4 \cdot a + 2 \cdot b + c \quad (2) \\ 42 & = & 9 \cdot a + 3 \cdot b + c \quad (3) \end{array} \quad \begin{array}{c} (3) - 3 \cdot (1) \\ \rightarrow \end{array} \quad \begin{array}{rcl} 42 & = & 9 \cdot a + 3 \cdot b + c \\ -3 \cdot 16 & = & 3 \cdot a + 3 \cdot b + 3 \cdot c \\ \hline -6 & = & 6 \cdot a + 0 - 2 \cdot c \quad \Leftrightarrow \quad \mathbf{a = (2 \cdot c - 6) / 6} \end{array}$$

$$\begin{array}{rcl} 16 & = & a + b + c \quad (1) \\ 27 & = & 4 \cdot a + 2 \cdot b + c \quad (2) \\ 42 & = & 9 \cdot a + 3 \cdot b + c \quad (3) \end{array} \quad \begin{array}{c} (2) - 2 \cdot (1) \\ \rightarrow \end{array} \quad \begin{array}{rcl} 27 & = & 4 \cdot a + 2 \cdot b + c \\ -2 \cdot 16 & = & 2 \cdot a + 2 \cdot b + 2 \cdot c \\ \hline -5 & = & 2 \cdot a - c \quad \Leftrightarrow \quad \mathbf{a = (c - 5) / 2} \end{array}$$

Advanced Example

- **We have computed that:**

- $a = (2 \cdot c - 6)/6$

- $a = (c - 5)/2$

- $(2 \cdot c - 6)/6 = (c - 5)/2 \Leftrightarrow c - 5 = \frac{2}{3} \cdot c - 2 \Leftrightarrow \frac{1}{3} c = 3 \Leftrightarrow c = 9$

Notes

Notes

- **Your final implementation should be a**
one executable file per question
 - Many source code files
- **Follow the execution instructions**
 - e.g. CLI arguments, arguments order
- **Allowed to use mentioned libraries**

Turnin

What to **submit**:

1. Source files
2. Test programs
3. Makefile
4. README

➤ `turnin assignment_1@hy457 directory_name`

Notes

- This year assignment 1 is **25%** of final grade
- Assignment 2 will be online after the Easter holidays
- **40% Assignments:**
 - Assignment 1: 25%
 - Assignment 2: 15%
- **60% Final Exam**
