Introduction to Map/Reduce: From Hadoop to SPARK

Serafeim Mustakas
Computer Science Department
University of Crete, Greece
What we will cover…

- Dataflow Languages for Cluster Computing
- What is MapReduce?
- How does it work?
- A simple word count example
  - (the “Hello World!” of MapReduce)
- From MapReduce to Spark
The datacenter *is* the computer!
What’s the instruction set?
So you like programming in assembly?
Traditional Network Programming

Message-passing between nodes (e.g. MPI)

Very difficult to do at scale:
• How to split problem across nodes?
  • Must consider network & data locality

How to deal with failures? (inevitable at scale)

Even worse: stragglers (node not failed, but slow)

Ethernet networking not fast
• Have to write programs for each machine
Data Flow Models

Restrict the programming interface so that the system can do more automatically

Express jobs as graphs of high-level operators »System picks how to split each operator into tasks and where to run each task
  • Run parts twice fault recovery

Biggest example: MapReduce
Why Use a Data Flow Engine?

Ease of programming
• High-level functions instead of message passing

Wide deployment
• More common than MPI, especially “near” data

Scalability to very largest clusters
• Even HPC world is now concerned about resilience

Examples: Pig, Hive, Scalding, Storm, Spark
Data–Parallel Dataflow Languages

We have a collection of records, want to apply a bunch of operations to compute some result

Assumption: static collection of records (what’s the limitation here?)
We Need Per-record Processing

Remarks: Easy to parallelize maps, record to “mapper” assignment is an implementation detail
What is MapReduce?

A programming model for processing large datasets in parallel on a cluster, by dividing the work into a set of independent tasks (introduced by Google in 2005)

All we have to do is provide the implementation of two methods:
• map()
• reduce()

…but we can do much more…

even that, is optional!
How does it work?

**keys and values**

- everything is expressed as \((key, value)\) pairs
  - e.g. the information that the word “hello” appears 4 times in a text, could be expressed as: \(\text{("hello", 4)}\)

Each **map** method receives a list of \((key, value)\) pairs and emits a list of \((key, value)\) pairs

- the intermediate output of the program

Each **reduce** method receives, for each unique intermediate key \(k\), a **list** of all intermediate values that were emitted for \(k\).
Then, it emits a list of \((key, value)\) pairs

- the final output of the program
MapReduce – Input Data

Mapper 1

Mapper 2

Mapper 3
MapReduce – Shuffling & Sorting (simplified)
MapReduce – Reducing

Reducer 1

Reducer 2

Reducer 3
Example: WordCount

- **Input**: A list of (file-name, line) pairs
- **Output**: A list of (word, frequency) pairs for each unique word appearing in the input

**Idea:**

**Map:**

for each word \( w \), emit a \((w, 1)\) pair

**Reduce:**

for each \((w, \text{list}(1,1,...,1))\), sum up the 1's and emit a \((w, 1+1+...+1)\) pair
Example: WordCount

<table>
<thead>
<tr>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>file1.txt</td>
<td>hello, 1 world, 1</td>
</tr>
<tr>
<td>file2.txt</td>
<td>the, 1 the, 1 little, 1</td>
</tr>
<tr>
<td>file3.txt</td>
<td>big, 1 fish, 1 eat, 1</td>
</tr>
<tr>
<td></td>
<td>fish, 1 chips, 1 please, 1</td>
</tr>
</tbody>
</table>

| 1 part         | 00000                   |
| 2 part         | 00000                   |
| 3 part         | 00000                   |
public static class Map extends Mapper<LongWritable, Text, Text, IntWritable> {
    private final static IntWritable one = new IntWritable(1);
    private Text word = new Text();

    public void map(LongWritable key, Text value, Context context) throws IOException, InterruptedException {
        String line = value.toString();
        StringTokenizer tokenizer = new StringTokenizer(line);
        while (tokenizer.hasMoreTokens()) {
            word.set(tokenizer.nextToken());
            context.write(word, one);
        }
    }
}
public static class Reduce extends Reducer<Text, IntWritable, Text, IntWritable>

public void reduce(Text key, Iterable<IntWritable> values, Context context)
    throws IOException, InterruptedException {
    int sum = 0;
    for (IntWritable val : values) {
        sum += val.get();
    }
    context.write(key, new IntWritable(sum));
}
Combiner: a local, mini-reducer

- An optional class that works like a reducer, run locally
  - for the output of each mapper

- Goal:
  - reduce the network traffic from mappers to reducers
    - could be a bottleneck
  - reduce the workload of the reducers

WordCount Example:
We could sum up the local 1’s corresponding to the same key and emit a temporary word count to the reducer
  - fewer pairs are sent to the network
  - the reducers save some operations
WordCount with Combiner

<table>
<thead>
<tr>
<th>File</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>file1.txt</td>
<td>hello world</td>
<td>hello, 1 world, 1</td>
</tr>
<tr>
<td>file2.txt</td>
<td>the big fish eat the little fish</td>
<td>the, 2 little, 1</td>
</tr>
<tr>
<td>file3.txt</td>
<td>hello, fish and chips please!</td>
<td>hello, 1 and, 1</td>
</tr>
</tbody>
</table>

Map

Reduce

Reduce

Map

Map

Map

Output

and, 1
hello, 2
little, 1
the, 2
world, 1

big, 1
chips, 1

part - 0 0 0 0 0

part - 0 0 0 0
Map Alone Isn’t Enough!

Where do intermediate results go?
We need an addressing mechanism!
What’s the semantics of the group by?

Once we resolve the addressing, apply another computation
That’s what we call reduce!
(What’s with the sorting then?)
MapReduce is the minimally "interesting" dataflow!
MapReduce

List[(K1, V1)]

```plaintext
map
f: (K1, V1) ⇒ List[(K2, V2)]
```

```plaintext
reduce
g: (K2, Iterable[V2]) ⇒ List[(K3, V3)]
```

List[(K3, V3)]
MapReduce Workflows

What’s wrong?
Want MM?
Want MRR?
Spark

Answer to “What’s beyond MapReduce?”

Brief history:
Developed at UC Berkeley AMPLab in 2009
Open-sourced in 2010
Became top-level Apache project in February 2014
Commercial support provided by DataBricks
Spark vs. Hadoop Popularity

MapReduce

List[(K1, V1)]

map
f: (K1, V1) ⇒ List[(K2, V2)]

reduce
g: (K2, Iterable[V2]) ⇒ List[(K3, V3)]

List[(K3, V3)]
Map-like Operations

- **map**: $f : (T) \Rightarrow U$
  - Input: $RDD[T]$
  - Output: $RDD[U]$

- **filter**: $f : (T) \Rightarrow Boolean$
  - Input: $RDD[T]$
  - Output: $RDD[T]$

- **flatMap**: $f : (T) \Rightarrow TraversableOnce[U]$
  - Input: $RDD[T]$
  - Output: $RDD[U]$

- **mapPartitions**: $f : (Iterator[T]) \Rightarrow Iterator[U]$
  - Input: $RDD[T]$
  - Output: $RDD[U]$

(Not meant to be exhaustive)
Reduce–like Operations

- `RDD[(K, V)]`
  - `groupByKey`
    - `RDD[(K, Iterable[V])]`
- `RDD[(K, V)]`
  - `reduceByKey`
    - `f: (V, V) ⇒ V`
    - `RDD[(K, V)]`
- `RDD[(K, V)]`
  - `aggregateByKey`
    - `seqOp: (U, V) ⇒ U`
    - `combOp: (U, U) ⇒ U`
    - `RDD[(K, U)]`

(Not meant to be exhaustive)
Sort Operations

(RDD[(K, V)])

sort

(RDD[(K, V)])

repartitionAndSortWithinPartitions

(RDD[(K, V)])

(Not meant to be exhaustive)
Join–like Operations

### Join

- `RDD[(K, V)]`
- `RDD[(K, W)]`

- `join`

- `RDD[(K, (V, W))]]`

### Cogroup

- `RDD[(K, V)]`
- `RDD[(K, W)]`

- `cogroup`

- `RDD[(K, (Iterable[V], Iterable[W]))]`

(Not meant to be exhaustive)
Join–like Operations

- `leftOuterJoin`
  - `RDD[(K, V)]`
  - `RDD[(K, W)]`
  - `RDD[(K, (V, Option[W]))]`

- `fullOuterJoin`
  - `RDD[(K, V)]`
  - `RDD[(K, W)]`
  - `RDD[(K, (Option[V], Option[W]))]`

(Not meant to be exhaustive)
Set-ish Operations

(Not meant to be exhaustive)
Set-ish Operations

\[
\text{RDD}[T] \xrightarrow{\text{distinct}} \text{RDD}[T]
\]

\[
\text{RDD}[T] \xrightarrow{\text{cartesian}} \text{RDD}[(T, U)]
\]

(Not meant to be exhaustive)
MapReduce in Spark?

- **map**
  - `f: (T) ⇒ (K, V)`
  - `reduceByKey`
    - `f: (V, V) ⇒ V`
  - `RDD[(K, V)]`

- **flatMap**
  - `f: (T) ⇒ TO[(K, V)]`
  - `reduceByKey`
    - `f: (V, V) ⇒ V`
  - `RDD[(K, V)]`

*Not quite…*
MapReduce in Spark?

```plaintext
RDD[T] → flatMap
  f: (T) ⇒ TO[(K,V)]

RDD[(R, S)] → map
  f: ((K, Iter[V])) ⇒ (R,S)

RDD[(R, S)] → groupByKey

RDD[T] → mapPartitions
  f: (Iter[T]) ⇒ Iter[(K,V)]

RDD[(R, S)] → map
  f: ((K, Iter[V])) ⇒ (R,S)

RDD[(R, S)] → groupByKey
```

Still not quite...
Spark Word Count

```scala
val textFile = sc.textFile(args.input())

textFile
  .flatMap(line => tokenize(line))
  .map(word => (word, 1))
  .reduceByKey(_ + _)
  .saveAsTextFile(args.output())

(x, y) => x + y
```

Aside: Scala tuple access notation, e.g., `a._1`
val textFile = sc.textFile(args.input())

textFile
  .map(object mapper {
    def map(key: Long, value: Text) =
      tokenize(value).foreach(word => write(word, 1))
  })
  .reduce(object reducer {
    def reduce(key: Text, values: Iterable[Int]) = {
      var sum = 0
      for (value <- values) sum += value
      write(key, sum)
    }
  })
  .saveAsTextFile(args.output())
Install Spark

Let’s get started using Apache Spark, in just four easy steps...

Step 1: Install Java JDK 6/7 on MacOSX or Windows
oracl,e.com/technetwork/java/javase/downloads/jdk7-downloads-1880260.html
follow the license agreement instructions
then click the download for your OS
need JDK instead of JRE (for Maven, etc.)
this is much simpler on Linux: sudo apt-get -y install openjdk-7-jdk
Step 2: Download the latest Spark version 2.4.4
open spark.apache.org/downloads.html with a browser
double click the archive file to open it
connect into the newly created directory
Install Spark

Step 3: Run Spark Shell
we’ll run Spark’s interactive shell…

```
./bin/spark-shell
```
then from the “scala>” REPL prompt,
let’s create some data…

```scala
val data = 1 to 10000
```

Step 4: Create an RDD
create an RDD based on that data…

```scala
val distData = sc.parallelize(data)
```
then use a filter to select values less than 10…

```
distData.filter(_ < 10).collect()
```

Check your output:
gist.github.com/ceteri/f2c3486062c9610eac1d#file-01-repl-txt
Optional Downloads

Python:
For Python 2.7, check out Anaconda by Continuum Analytics for a full-featured platform: store.continuum.io/cshop/anaconda/

Maven
Java builds later also require Maven, which you can download at: maven.apache.org/download.cgi
