• A d-dimensional random variable follows a Gaussian, or Normal, probability law: $x \to \mathcal{N}(\mu, \Sigma)$

$$g_{(\mu,\Sigma)}(x) = \frac{1}{\sqrt{2\pi}^d \sqrt{\det\left(\Sigma\right)}} e^{-\frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)}$$

where μ is the mean vector and Σ is the variance-covariance matrix.

- If $x \to \mathcal{N}(0, I)$ and if $y = \sqrt{\Sigma} x + \mu$, then $y \to \mathcal{N}(\mu, \Sigma)$.
- $\sqrt{\Sigma}$ defines the *standard deviation* of the random variable x. Note this square root is meant in the *matrix sense*.

• A d-dimensional random variable follows a Gaussian, or Normal, probability law: $x \to \mathcal{N}(\mu, \Sigma)$

$$g_{(\mu,\Sigma)}(x) = \frac{1}{\sqrt{2\pi}^d \sqrt{\det\left(\Sigma\right)}} e^{-\frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)}$$

where μ is the mean vector and Σ is the variance-covariance matrix.

- If $x \to \mathcal{N}(0, I)$ and if $y = \sqrt{\Sigma} x + \mu$, then $y \to \mathcal{N}(\mu, \Sigma)$.
- $\sqrt{\Sigma}$ defines the *standard deviation* of the random variable x. Note this square root is meant in the *matrix sense*.

• Ad-dimensional random variable follows a Gaussian, or Normal, probability law: $\times \to \mathcal{N}(\mu, \Sigma)$

$$g_{(\mu,\Sigma)}(x) = \underbrace{\sqrt{2\pi}^d \sqrt{\det(\Sigma)}} e^{-\frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)}$$

where μ is the mean vector and Σ is the variance-covariance matrix.

- If $x \to \mathcal{N}(0, I)$ and if $y = \sqrt{\Sigma} x + \mu$, then $y \to \mathcal{N}(\mu, \Sigma)$.
- $\sqrt{\Sigma}$ defines the standard deviation of the random variable x. Note this square root is meant in the matrix sense.

• Mean estimator:

$$\hat{\mu} = \frac{1}{N} \sum_{i=1}^{N} x_i$$

Unbiased covariance estimator:

$$\hat{\Sigma} = \frac{1}{N-1} \sum_{i=1}^{N} (x_i - \mu)(x_i - \mu)^T$$

• Mean estimator:

$$\hat{\mu} = \frac{1}{N} \sum_{i=1}^{N} x_i$$

• Unbiased covariance estimator:

$$\hat{\Sigma} = \frac{1}{N-1} \sum_{i=1}^{N} (x_i - \mu)(x_i - \mu)^T \\
(d \times 1) (1 \times d) = d \times d$$

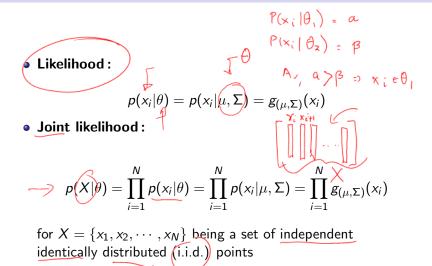

• Likelihood:

$$p(x_i|\theta) = p(x_i|\mu, \Sigma) = g_{(\mu,\Sigma)}(x_i)$$

Joint likelihood:

$$p(X|\theta) = \prod_{i=1}^{N} p(x_i|\theta) = \prod_{i=1}^{N} p(x_i|\mu, \Sigma) = \prod_{i=1}^{N} g_{(\mu, \Sigma)}(x_i)$$

for $X = \{x_1, x_2, \dots, x_N\}$ being a set of independent identically distributed (i.i.d.) points

• Log likelihood:

$$p(X|\theta) = \prod_{i=1}^{N} p(x_i|\theta) \quad \Leftrightarrow \quad \log p(X|\theta) = \sum_{i=1}^{N} \log p(x_i|\theta)$$

• In the Gaussian case:

$$p(x|\theta) = \frac{1}{\sqrt{2\pi}^d \sqrt{\det(\Sigma)}} e^{-\frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)}$$

$$g p(x|\theta) = -\frac{d}{2} \log(2\pi) - \frac{1}{2} \log(\det(\Sigma)) - \frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)$$

• Property:

$$p(x|\theta_1) > p(x|\theta_2) \Leftrightarrow \log p(x|\theta_1) > \log p(x|\theta_2)$$

Log likelihood:

$$p(X|\theta) = \prod_{i=1}^{N} p(x_i|\theta) \quad \Leftrightarrow \quad \log p(X|\theta) = \sum_{i=1}^{N} \log p(x_i|\theta)$$

• In the Gaussian case:

$$p(x|\theta) = \frac{1}{\sqrt{2\pi}^d \sqrt{\det\left(\Sigma\right)}} e^{-\frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)}$$

$$\log p(x|\theta) = -\frac{d}{2} \log (2\pi) - \frac{1}{2} \log \left(\det\left(\Sigma\right)\right) - \frac{1}{2} (x-\mu)^T \Sigma^{-1}(x-\mu)$$

• Property:

$$p(x|\theta_1) > p(x|\theta_2) \Leftrightarrow \log p(x|\theta_1) > \log p(x|\theta_2)$$

• Log likelihood:

$$\begin{array}{c}
P(X \mid \theta_{i}) \\
P(X \mid \theta_{3})
\end{array}$$

$$P(X \mid \theta_{3})$$

• In the Gaussian case:

$$p(x|\theta) = \frac{1}{\sqrt{2\pi}^d \sqrt{\det(\Sigma)}} e^{-\frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)}$$

$$\log p(x|\theta) = -\frac{d}{2} \log(2\pi) - \frac{1}{2} \log(\det(\Sigma)) - \frac{1}{2}(x-\mu)^T \Sigma^{-1}(x-\mu)$$

Property:

$$p(x|\theta_1) > p(x|\theta_2) \Leftrightarrow \log p(x|\theta_1) > \log p(x|\theta_2)$$

DISCUSSION

- A-priori class probability
- Gaussian modeling of classes

DISCUSSION

- A-priori class probability
- Gaussian modeling of classes

Bayes' decision rule:

$$X \in q_k$$
 if $P(q_k|X,\Theta) \ge P(q_j|X,\Theta), \ \forall j \ne k$

with $P(q_k|X,\Theta)$ being a posteriori probability (while $P(q_k|\Theta)$ is the a priori probability) for classes q_k . Note Θ represents the set of all θ .

A posteriori probability :

$$P(q_k|X,\Theta) = \frac{p(X|q_k,\Theta)P(q_k|\Theta)}{p(X|\Theta)}$$

(Bayes' law)

• For speech:

$$\forall k, \ P(q_k|X,\Theta) \propto p(X|q_k,\Theta)P(q_k|\Theta)$$

$$\log P(q_k|X,\Theta) \simeq \log p(X|q_k,\Theta) + \log P(q_k|\Theta)$$

Bayes' decision rule:

$$X \in q_k$$
 if $P(q_k|X,\Theta) \ge P(q_j|X,\Theta), \ \forall j \ne k$

with $P(q_k|X,\Theta)$ being a posteriori probability (while $P(q_k|\Theta)$ is the a priori probability) for classes q_k . Note Θ represents the set of all θ .

A posteriori probability :

$$P(q_k|X,\Theta) = \frac{p(X|q_k,\Theta)P(q_k|\Theta)}{p(X|\Theta)}$$

(Bayes' law)

• For speech:

$$\forall k, \ P(q_k|X,\Theta) \propto p(X|q_k,\Theta)P(q_k|\Theta)$$

$$\log P(q_k|X,\Theta) \simeq \log p(X|q_k,\Theta) + \log P(q_k|\Theta)$$

Bayes' decision rule:

$$X \in q_k$$
 if $P(q_k|X,\Theta) \ge P(q_j|X,\Theta), \ \forall j \ne k$

with $P(q_k|X,\Theta)$ being a posteriori probability (while $P(q_k|\Theta)$ is the a priori probability) for classes q_k . Note Θ represents the set of all θ .

A posteriori probability :

$$P(q_k|X,\Theta) = \frac{p(X|q_k,\Theta)P(q_k|\Theta)}{p(X|\Theta)}$$

(Bayes' law)

• For speech:

$$\forall k, \ P(q_k|X,\Theta) \propto p(X|q_k,\Theta)P(q_k|\Theta)$$

$$\log P(q_k|X,\Theta) \simeq \log p(X|q_k,\Theta) + \log P(q_k|\Theta)$$

Bayes' decision rule;

$$X \in q_k$$
 if $P(q_k|X)\Theta \ge P(q_j|X,\Theta), \forall j \ne k$

with $P(q_k|X, \Theta)$ being a posteriori probability (while $P(q_k|\Theta)$ is the a priori probability) for classes q_k . Note Θ represents the set of all θ .

A posteriori probability :

(Bayes' law)
$$P(q_k|X,\Theta) = p(X|q_k,\Theta)P(q_k|\Theta)$$

$$p(X|\Theta) = p(X|\Theta)$$

• For speech:

$$\forall k, P(q_k|X,\Theta) \propto p(X|q_k,\Theta)P(q_k|\Theta)$$

$$\log P(q_k|X,\Theta) \simeq \log p(X|q_k,\Theta) + \log P(q_k|\Theta)$$

- 3 Unsupervised training
- 4 ACKNOWLEDGMENTS

- a set of models q_k (not necessarily Gaussian), defined by some parameters Θ (means, variances, priors,...);
- a measure of membership, telling to which extent a data point "belongs" to a model;
- the above implicitly defines global criterion of "goodness of fit" of the models to the data, e.g.:
 - in the case of a distance, the models that are globally closer from the data characterize it better;
 - in the case of a probability measure, the models bringing a better likelihood for the data explain it better.
- a "recipe" to update the model parameters in function of the membership information.

- Start with K initial prototypes μ_k , $k = 1, \dots, K$.
- Do:
 - For each data-point x_n , $n = 1, \dots, N$, compute:

$$d_k(x_n) = (x_n - \mu_k)^T (x_n - \mu_k)$$

Assign each data-point x_n to its **closest** prototype μ_k , i.e assign x_n to the class q_k if:

$$d_k(x_n) \leq d_l(x_n), \ \forall l \neq k$$

- Replace each prototype with the mean of the data-points assigned to the corresponding class;
- Go to 1.
- Until: no further change occurs.

- Start with K initial prototypes μ_k , $k = 1, \dots, K$.
- Do:
 - ① For each data-point x_n , $n = 1, \dots, N$, compute:

$$d_k(x_n) = (x_n - \mu_k)^T (x_n - \mu_k)$$

2 Assign each data-point x_n to its **closest** prototype μ_k , i.e. assign x_n to the class q_k if:

$$d_k(x_n) \leq d_l(x_n), \ \forall l \neq k$$

- Replace each prototype with the mean of the data-points assigned to the corresponding class;
- Go to 1.
- Until: no further change occurs.

- Start with K initial prototypes μ_k , $k = 1, \dots, K$.
- Do:
 - **1** For each data-point x_n , $n = 1, \dots, N$, compute:

$$d_k(x_n) = (x_n - \mu_k)^T (x_n - \mu_k)$$

2 Assign each data-point x_n to its **closest** prototype μ_k , i.e. assign x_n to the class q_k if:

$$d_k(x_n) \leq d_l(x_n), \ \forall l \neq k$$

- Replace each prototype with the mean of the data-points assigned to the corresponding class;
- Go to 1.
- Until: no further change occurs.

- Start with K initial prototypes μ_k , $k = 1, \dots, K$.
- Do :
 - **①** For each data-point x_n , $n = 1, \dots, N$, compute:

$$d_k(x_n) = (x_n - \mu_k)^T (x_n - \mu_k)$$

② Assign each data-point x_n to its **closest** prototype μ_k , i.e. assign x_n to the class q_k if:

$$d_k(x_n) \leq d_l(x_n), \ \forall l \neq k$$

- Replace each prototype with the mean of the data-points assigned to the corresponding class;
- @ Go to 1.
- Until: no further change occurs.

- Start with K initial prototypes μ_k , $k = 1, \dots, K$.
- Do :
 - **①** For each data-point x_n , $n = 1, \dots, N$, compute:

$$d_k(x_n) = (x_n - \mu_k)^T (x_n - \mu_k)$$

② Assign each data-point x_n to its **closest** prototype μ_k , i.e. assign x_n to the class q_k if:

$$d_k(x_n) \leq d_l(x_n), \ \forall l \neq k$$

- Replace each prototype with the mean of the data-points assigned to the corresponding class;
- Go to 1.
- Until: no further change occurs.

- Start with K initial prototypes μ_k , $k = 1, \dots, K$.
- Do :
 - **1** For each data-point x_n , $n = 1, \dots, N$, compute:

$$d_k(x_n) = (x_n - \mu_k)^T (x_n - \mu_k)$$

② Assign each data-point x_n to its **closest** prototype μ_k , i.e. assign x_n to the class q_k if:

$$d_k(x_n) \leq d_l(x_n), \ \forall l \neq k$$

- Replace each prototype with the mean of the data-points assigned to the corresponding class;
- **4** Go to 1.
- Until: no further change occurs.

- Start with K initial prototypes μ_k , $k = 1, \dots, K$.
- Do :
 - For each data-point x_n , $n = 1, \dots, N$, compute:

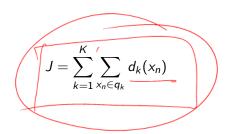

$$\rightarrow d_k(x_n) = (x_n - \mu_k)^T (x_n - \mu_k)$$

Assign each data-point x_n to its **closest** prototype μ_k , i.e. assign x_n to the class q_k if:

$$d_k(x_n) \leq d_l(x_n), \ \forall l \neq k$$

- Replace each prototype with the mean of the data-points assigned to the corresponding class;
- Go to 1.
- **Until**: no further change occurs.

Global criterion:

VITERBI-EM ALGORITHM FOR GAUSSIANS

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k)$, $k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do:
 - ① Classify each data-point to its most probable cluster $q_k^{(old)}$ using Bayes' rule.
 - Update the parameters

- Go to 1.
- **Until**: no further change occurs.

VITERBI-EM ALGORITHM FOR GAUSSIANS

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k), \ k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do:
 - ① Classify each data-point to its most probable cluster $q_k^{(old)}$ using Bayes' rule.
 - Update the parameters:
 - update the means:

$$\mu_k^{(extit{new})} =$$
 mean of the points belonging to $q_k^{(extit{old})}$

update the variances

$$\Sigma_k^{(new)}=$$
 variance of the points belonging to $q_k^{(old)}$

update the priors:

$$P(q_k^{(new)}|\Theta^{(new)}) = rac{ ext{number of training points belonging to }q_k^{(olcolor)}}{ ext{total number of training points}}$$

- Go to 1.
- Until: no further change occurs.

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k), \ k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do:
 - Classify each data-point to its most probable cluster $q_k^{(old)}$ using Bayes' rule.
 - ② Update the parameters:
 - update the means:
 - $\mu_k^{(new)} =$ mean of the points belonging to $q_k^{(old)}$
 - update the variances:
 - $\Sigma_k^{(new)} =$ variance of the points belonging to $q_k^{(old)}$
 - update the priors:
 - $P(q_k^{(new)}|\Theta^{(new)}) = \frac{\text{number of training points belonging to } q_k^{(or)}}{\text{total number of training points}}$
 - 3 Go to 1.
- Until: no further change occurs.

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k)$, $k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do:
 - Classify each data-point to its most probable cluster $q_k^{(old)}$ using Bayes' rule.
 - Update the parameters:
 - update the means:

$$\mu_k^{(extit{new})} =$$
 mean of the points belonging to $oldsymbol{q}_k^{(extit{old})}$

• update the variances:

$$\Sigma_k^{(extit{new})}=$$
 variance of the points belonging to $q_k^{(extit{old})}$

$$P(q_k^{(new)}|\Theta^{(new)}) = rac{ ext{number of training points belonging to } q_k^{(ola)}}{ ext{total number of training points}}$$

- Go to 1.
- Until: no further change occurs.

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k), \ k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do:
 - Classify each data-point to its most probable cluster $q_k^{(old)}$ using Bayes' rule.
 - Update the parameters:
 - update the means:

$$\mu_k^{(\textit{new})} = \text{mean of the points belonging to } q_k^{(\textit{old})}$$

• update the variances:

$$\Sigma_k^{(new)}=$$
 variance of the points belonging to $q_k^{(old)}$

$$P(q_k^{(new)}|\Theta^{(new)}) = rac{ ext{number of training points belonging to } q_k^{(out)}}{ ext{total number of training points}}$$

- Go to 1.
- Until: no further change occurs.

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k), \ k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do:
 - Classify each data-point to its most probable cluster $q_k^{(old)}$ using Bayes' rule.
 - Update the parameters:
 - update the means:

$$\mu_k^{(\textit{new})} = \text{mean of the points belonging to } q_k^{(\textit{old})}$$

• update the variances:

$$\Sigma_k^{(new)}=$$
 variance of the points belonging to $q_k^{(old)}$

$$P(q_k^{(new)}|\Theta^{(new)}) = rac{\text{number of training points belonging to } q_k^{(obs)}}{\text{total number of training points}}$$

- Go to 1.
- Until: no further change occurs.

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k), \ k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do :
 - Classify each data-point to its most probable cluster $q_k^{(old)}$ using Bayes' rule.
 - Update the parameters:
 - update the means:

$$\mu_k^{(new)} =$$
 mean of the points belonging to $q_k^{(old)}$

update the variances:

$$\Sigma_k^{(\textit{new})} = ext{variance}$$
 of the points belonging to $q_k^{(\textit{old})}$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{\text{number of training points belonging to } q_k^{(old)}}{\text{total number of training points}}$$

- Go to 1.
- Until: no further change occurs.

- Assume K initial Gaussian models $\mathcal{N}(\mu_k, \Sigma_k), \ k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do :

 - Update the parameters:
 - update the means:

$$\mu_k^{(new)} =$$
 mean of the points belonging to $q_k^{(old)}$

• update the variances:

$$\Sigma_k^{(\textit{new})} = ext{variance}$$
 of the points belonging to $q_k^{(\textit{old})}$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{\text{number of training points belonging to } q_k^{(old)}}{\text{total number of training points}}$$

- Go to 1.
- Until: no further change occurs.

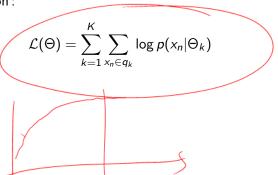

- Assume K initial Gaussian models $\mathcal{N}(\mu_k \Sigma_k)$, $k = 1 \cdots K$, and initial prior probabilities $P(q_k) = 1/K$.
- Do:
 - Classify each data-point to its most probable cluste $q_k^{(old)}$ using Bayes' rule.
 - Update the parameters:
 - update the means:
 - $\mu_k^{(extit{new})} =$ mean of the points belonging to $q_k^{(old)}$
 - update the variances:
 - $\sum_k^{(new)} =$ variance of the points belonging to $q_k^{(old)}$
 - update the priors:

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{\text{number of training points belonging to } q_k^{(old)}}{\text{total number of training points}}$$

- Go to 1.
- Until: no further change occurs.

Global criterion:

- Assume K *initial* models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step
 - $P(q_k^{(old)}|\mathbf{x}_n, \boldsymbol{\Theta}^{(old)}) = \frac{P(q_k^{(old)}|\boldsymbol{\Theta}^{(old)}) \cdot \rho(\mathbf{x}_n|\boldsymbol{\mu}_k^{(old)}, \boldsymbol{\Sigma}_k^{(old)})}{\sum_j P(q_j^{(old)}|\boldsymbol{\Theta}^{(old)}) \cdot \rho(\mathbf{x}_n|\boldsymbol{\mu}_k^{(old)}, \boldsymbol{\Sigma}_j^{(old)})}$
 - Maximization step

- Assume K initial models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step:

$$P(q_k^{(old)}|x_n, \Theta^{(old)}) = \frac{P(q_k^{(old)}|\Theta^{(old)}) \cdot p(x_n|\mu_k^{(old)}, \Sigma_k^{(old)})}{\sum_j P(q_j^{(old)}|\Theta^{(old)}) \cdot p(x_n|\mu_j^{(old)}, \Sigma_j^{(old)})}$$

- Maximization step
 - update the means:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

update the variances

$$\Sigma_k^{(new)} = \frac{\sum_{n=1}^N P(q_k^{(old)}|x_n, \Theta^{(old)})(x_n - \mu_k^{(new)})(x_n - \mu_k^{(new)})^{\top}}{\sum_{n=1}^N P(q_k^{(old)}|x_n, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = rac{1}{N}\sum_{i=1}^N P(q_k^{(old)}|\mathbf{x}_n,\Theta^{(old)})$$

- Assume K *initial* models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step:

$$P(q_{k}^{(old)}|x_{n},\Theta^{(old)}) = \frac{P(q_{k}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{k}^{(old)},\Sigma_{k}^{(old)})}{\sum_{j} P(q_{j}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{j}^{(old)},\Sigma_{j}^{(old)})}$$

2 Maximization step:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

update the variances:

$$\Sigma_{k}^{(new)} = \frac{\sum_{n=1}^{N} P(q_{k}^{(old)} | \mathbf{x}_{n}, \Theta^{(old)}) (\mathbf{x}_{n} - \mu_{k}^{(new)}) (\mathbf{x}_{n} - \mu_{k}^{(new)})^{T}}{\sum_{n=1}^{N} P(q_{k}^{(old)} | \mathbf{x}_{n}, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = rac{1}{N}\sum_{i=1}^N P(q_k^{(old)}|x_i,\Theta^{(old)})$$

- Assume K initial models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step:

$$P(q_{k}^{(old)}|x_{n},\Theta^{(old)}) = \frac{P(q_{k}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{k}^{(old)},\Sigma_{k}^{(old)})}{\sum_{j} P(q_{j}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{j}^{(old)},\Sigma_{j}^{(old)})}$$

- Maximization step:
 - update the means:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

• update the variances:

$$\Sigma_{k}^{(new)} = \frac{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})(x_{n} - \mu_{k}^{(new)})(x_{n} - \mu_{k}^{(new)})^{T}}{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{1}{N} \sum_{n=1}^N P(q_k^{(old)}|x_n, \Theta^{(old)})$$

- Assume K initial models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step:

$$P(q_{k}^{(old)}|x_{n},\Theta^{(old)}) = \frac{P(q_{k}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{k}^{(old)},\Sigma_{k}^{(old)})}{\sum_{j} P(q_{j}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{j}^{(old)},\Sigma_{j}^{(old)})}$$

- Maximization step:
 - update the means:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

update the variances:

$$\Sigma_{k}^{(new)} = \frac{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})(x_{n} - \mu_{k}^{(new)})(x_{n} - \mu_{k}^{(new)})^{T}}{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{1}{N} \sum_{n=1}^{N} P(q_k^{(old)}|x_n,\Theta^{(old)})$$

- Assume K initial models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step:

$$P(q_{k}^{(old)}|x_{n},\Theta^{(old)}) = \frac{P(q_{k}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{k}^{(old)},\Sigma_{k}^{(old)})}{\sum_{j} P(q_{j}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{j}^{(old)},\Sigma_{j}^{(old)})}$$

- Maximization step:
 - update the means:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

• update the variances:

$$\Sigma_{k}^{(new)} = \frac{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})(x_{n} - \mu_{k}^{(new)})(x_{n} - \mu_{k}^{(new)})^{T}}{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{1}{N} \sum_{n=1}^N P(q_k^{(old)}|x_n, \Theta^{(old)})$$

- Assume K initial models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step:

$$P(q_k^{(old)}|\mathbf{x}_n, \boldsymbol{\Theta}^{(old)}) = \frac{P(q_k^{(old)}|\boldsymbol{\Theta}^{(old)}) P(\mathbf{x}_n|\boldsymbol{\mu}_k^{(old)}, \boldsymbol{\Sigma}_k^{(old)})}{\sum_j P(q_j^{(old)}|\boldsymbol{\Theta}^{(old)}) P(\mathbf{x}_n|\boldsymbol{\mu}_j^{(old)}, \boldsymbol{\Sigma}_j^{(old)})}$$

- Maximization step:
 - update the means:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

• update the variances:

$$\sum_{k}^{(new)} = \frac{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)}) (x_n - \mu_k^{(new)}) (x_n - \mu_k^{(new)})^T}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{1}{N} \sum_{n=1}^{N} P(q_k^{(old)}|x_n, \Theta^{(old)})$$

- Assume K initial models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do:
 - Estimation step:

$$P(q_{k}^{(old)}|x_{n},\Theta^{(old)}) = \frac{P(q_{k}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{k}^{(old)},\Sigma_{k}^{(old)})}{\sum_{j} P(q_{j}^{(old)}|\Theta^{(old)}) \cdot p(x_{n}|\mu_{j}^{(old)},\Sigma_{j}^{(old)})}$$

- Maximization step:
 - update the means:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

update the variances:

$$\Sigma_{k}^{(new)} = \frac{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})(x_{n} - \mu_{k}^{(new)})(x_{n} - \mu_{k}^{(new)})^{T}}{\sum_{n=1}^{N} P(q_{k}^{(old)}|x_{n}, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{1}{N} \sum_{n=1}^{N} P(q_k^{(old)}|x_n, \Theta^{(old)})$$

- Assume K *initial* models $\mathcal{N}(\mu_k, \Sigma_k)$, with $P(q_k) = 1/K$.
- Do :
 - Estimation step:

$$P(q_k^{(old)}|x_n, \Theta^{(old)}) = \frac{P(q_k^{(old)}|\Theta^{(old)}) \cdot p(x_n|\mu_k^{(old)}, \Sigma_k^{(old)})}{\sum_j P(q_j^{(old)}|\Theta^{(old)}) \cdot p(x_n|\mu_j^{(old)}, \Sigma_j^{(old)})}$$

- Maximization step:
 - update the means:

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

$$\mu_k^{(new)} = \frac{\sum_{n=1}^{N} x_n P(q_k^{(old)} | x_n, \Theta^{(old)})}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$
 update the variances:
$$\Sigma_k^{(new)} = \frac{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})(x_n - \mu_k^{(new)})(x_n - \mu_k^{(new)})^T}{\sum_{n=1}^{N} P(q_k^{(old)} | x_n, \Theta^{(old)})}$$

$$P(q_k^{(new)}|\Theta^{(new)}) = \frac{1}{N} \sum_{n=1}^{N} P(q_k^{(old)}|x_n, \Theta^{(old)})$$

Global criterion:

$$\mathcal{L}(\Theta) = \log \sum_{k=1}^{K} P(q_k|X,\Theta) p(X|\Theta)$$
