- Ph.D. in Neuroscience, Rosalind Franklin University of Health and Sciences/The Chicago Medical School
- Post-doc in 'Computational Neuroscience' - IMBB-FORTH

Neurons, neuronal networks and brain

Neurons are the building blocks of the brain

- The human brain consists of 100 billion neurons

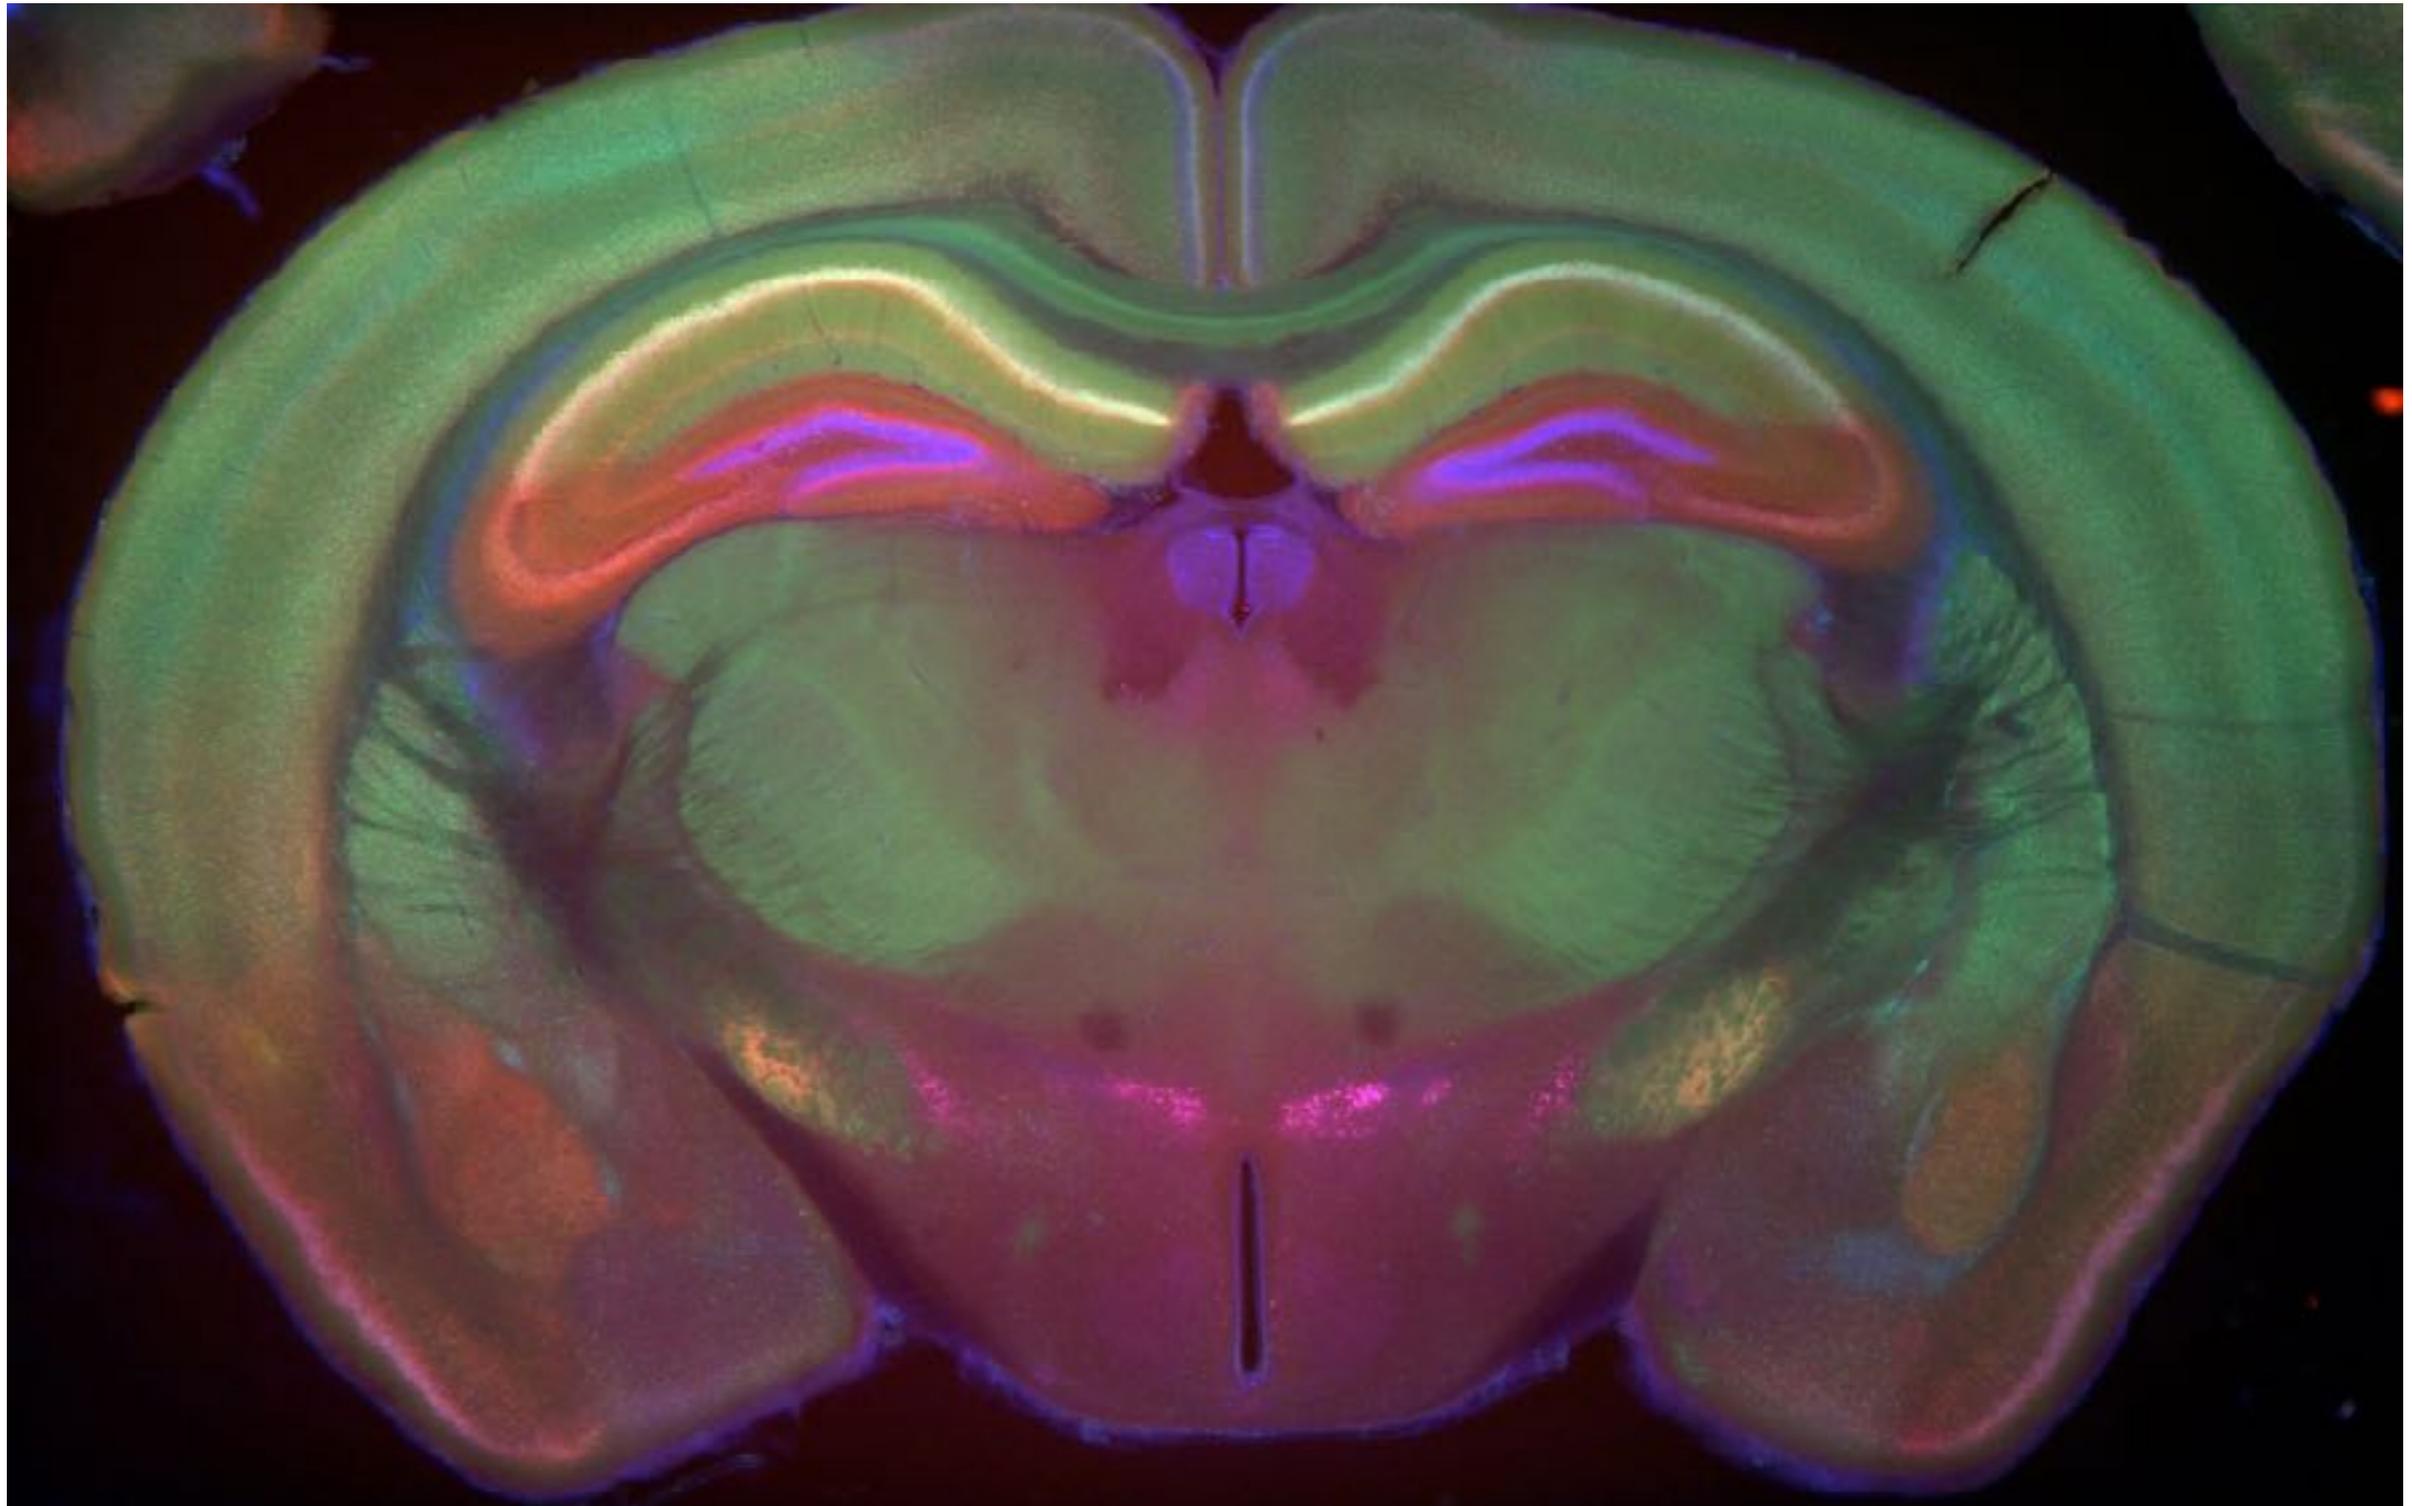

There are many different types of neurons

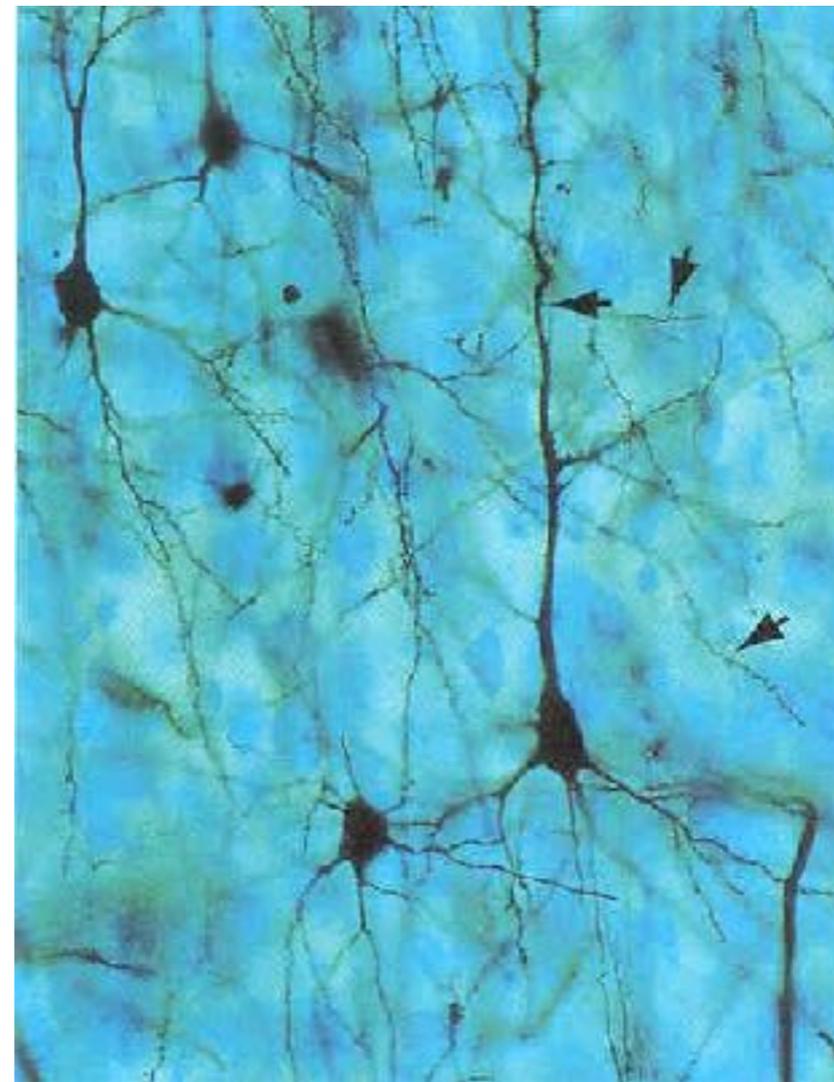

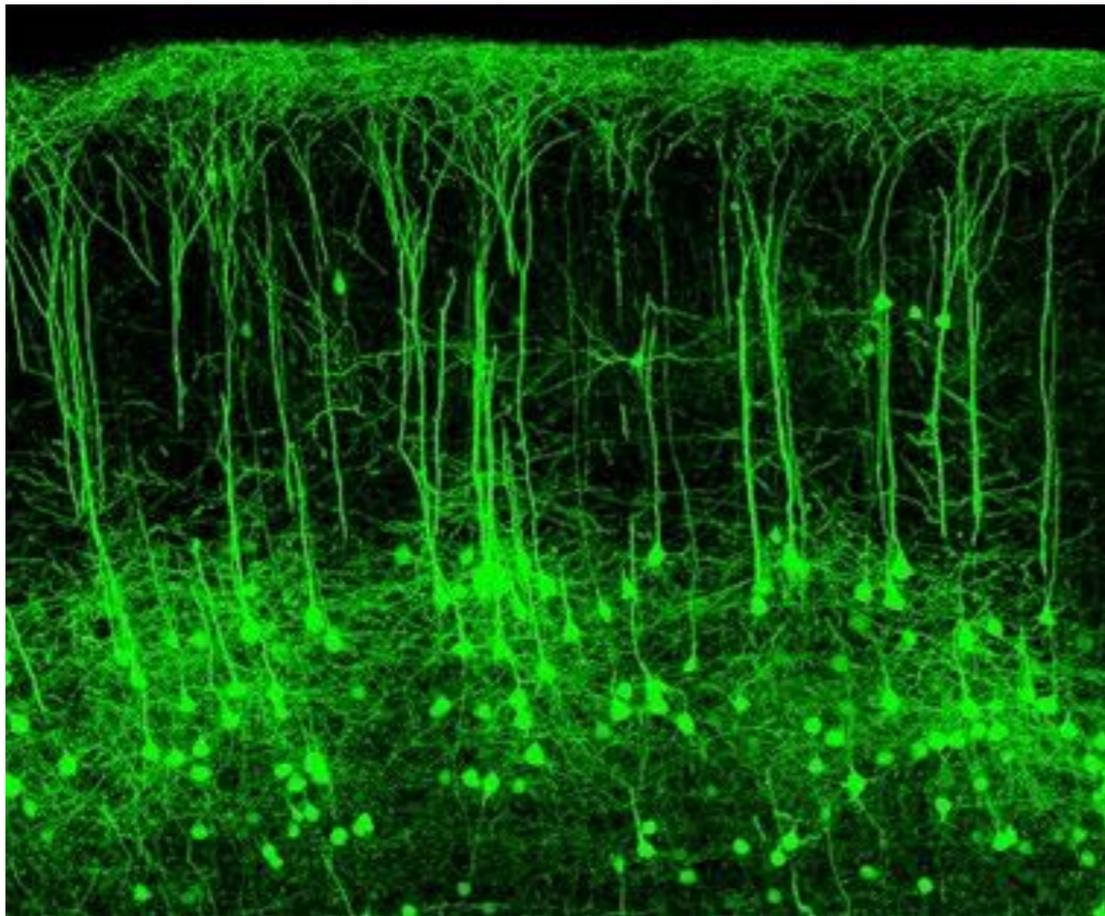

- According to the neurotransmitter
 - Glutamatergic, GABAergic, Dopaminergic, etc

Brain slice

Cortex, Hippocampus, thalamus, hypothalamus

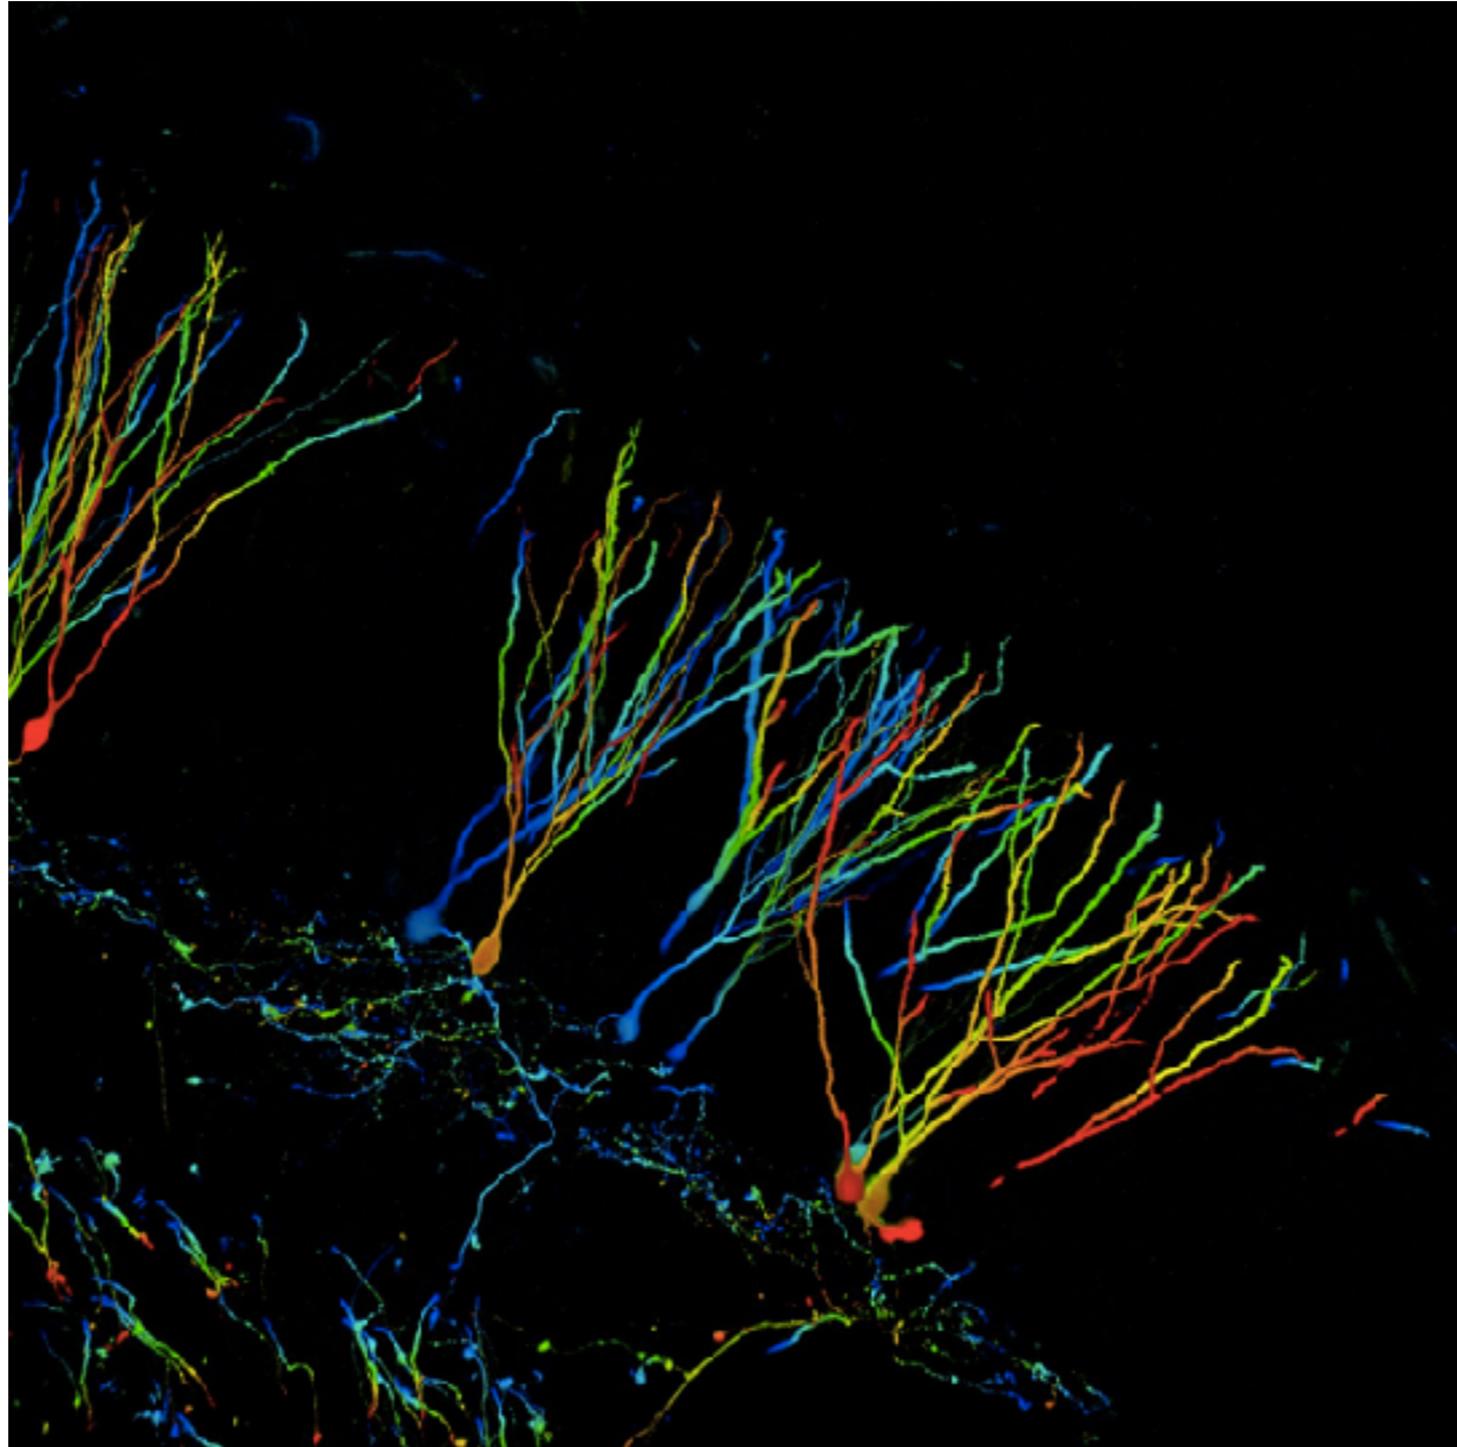

- Pyramidal neurons
 - Cortex, hippocampus, amygdala
 - Glutamatergic neurons
 - Projection neurons

Neurons communicate with each other to form networks through synapses

Neurons communicate with electrical signals

Neuronal networks in the brain

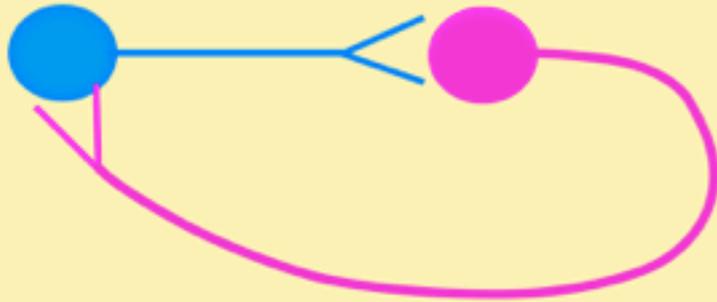

Ορθόδρομη διέγερση

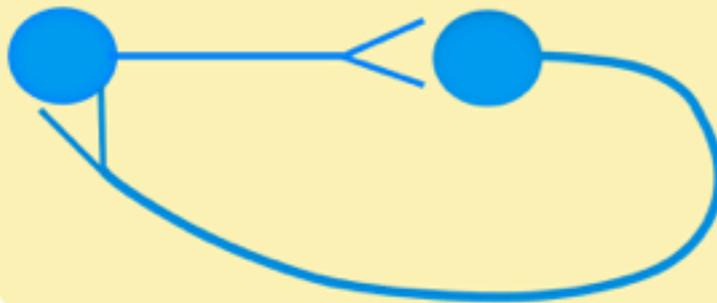

Ορθόδρομη αναστολή

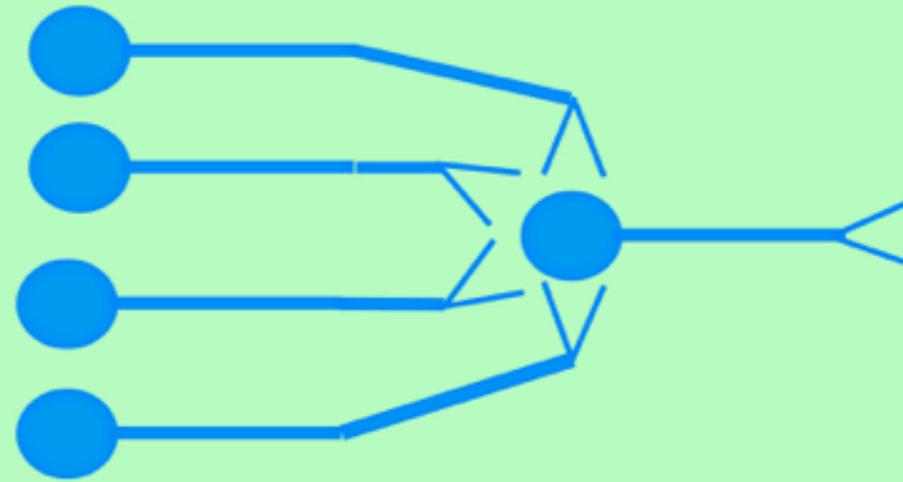

Οπισθόδρομη ή Ανατροφοδοτούμενη αναστολή

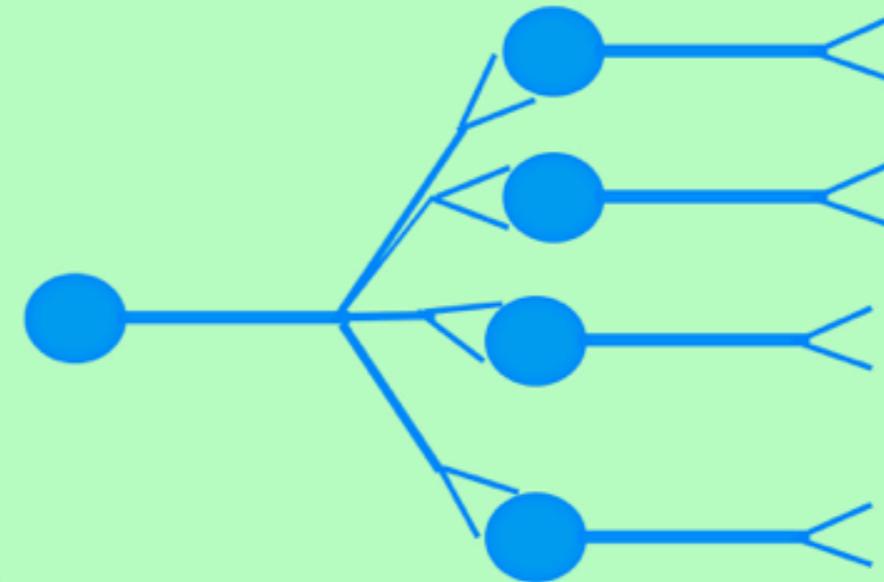

Οπισθόδρομη ή Ανατροφοδοτούμενη διέγερση

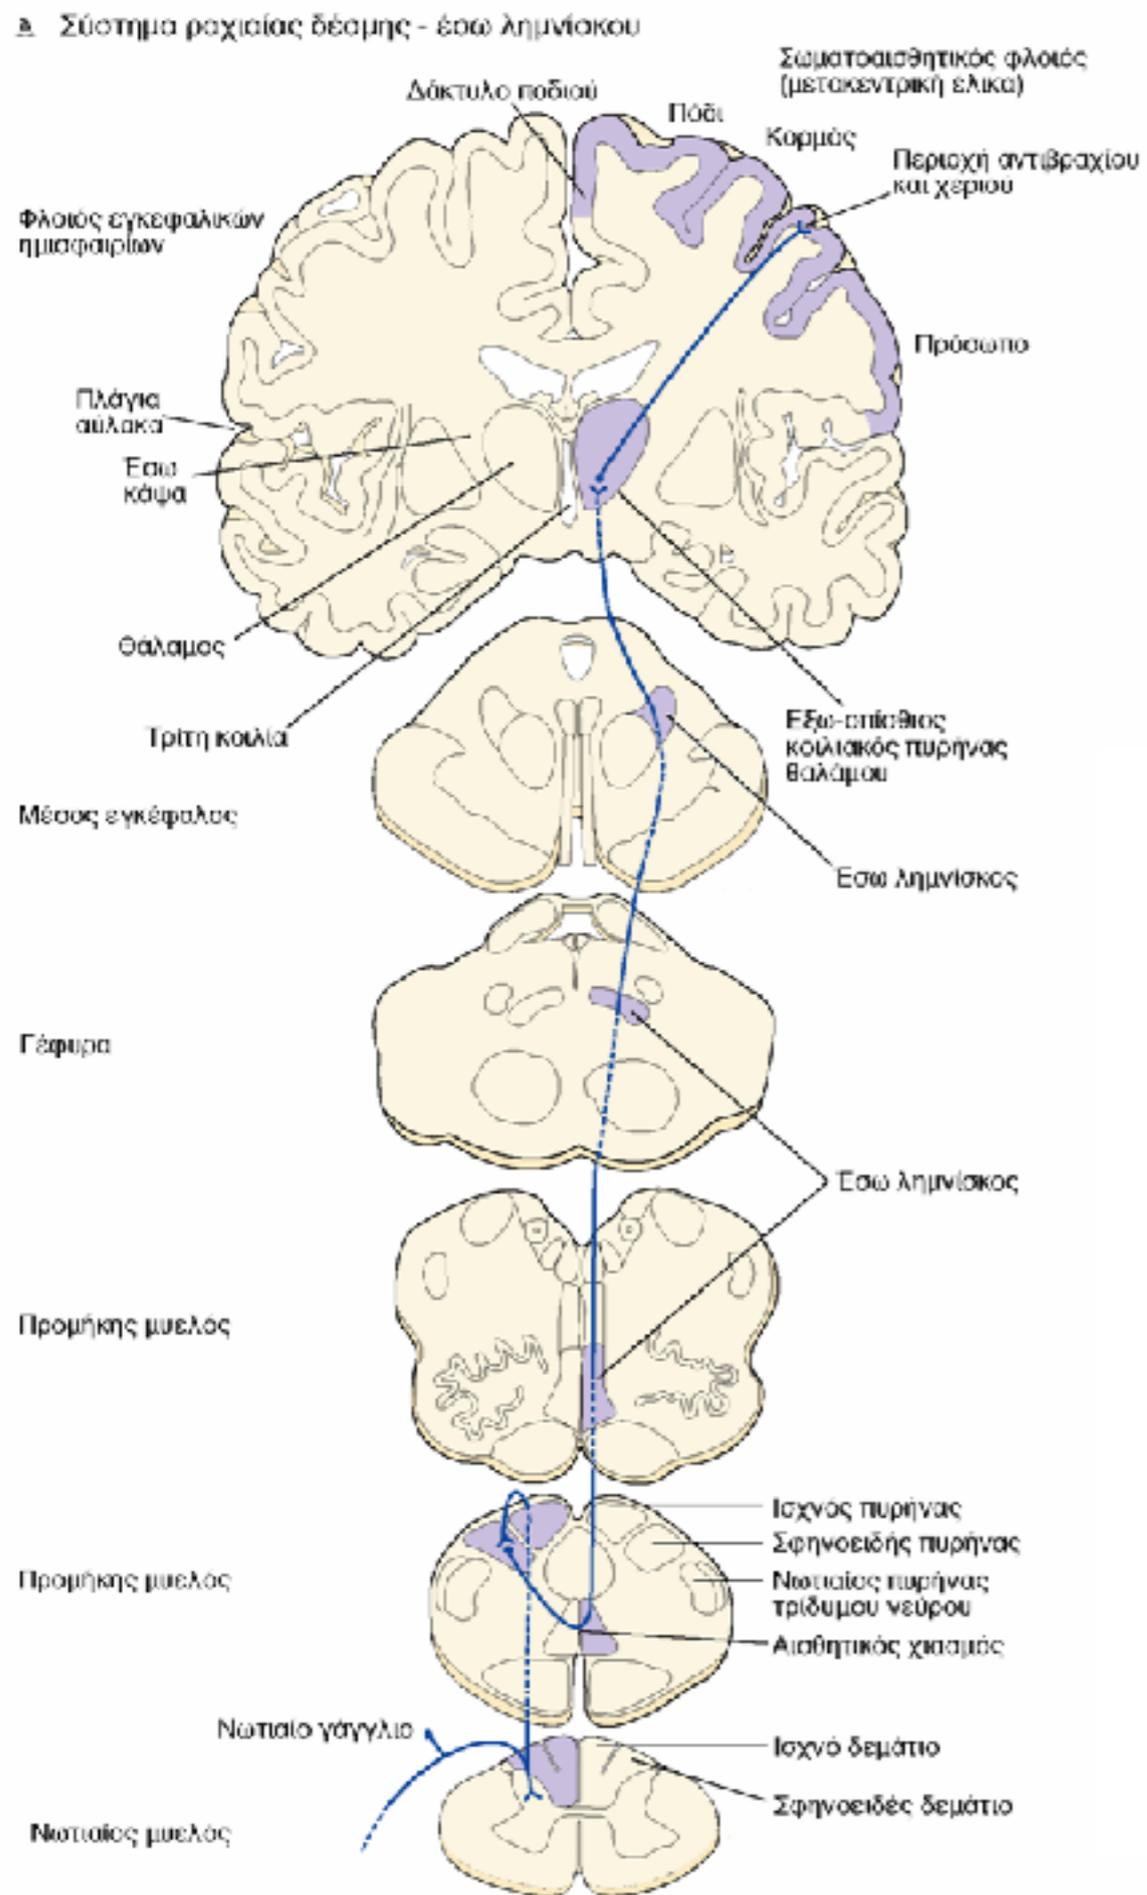

Συγκλινόμενα νευρωνικά δίκτυα

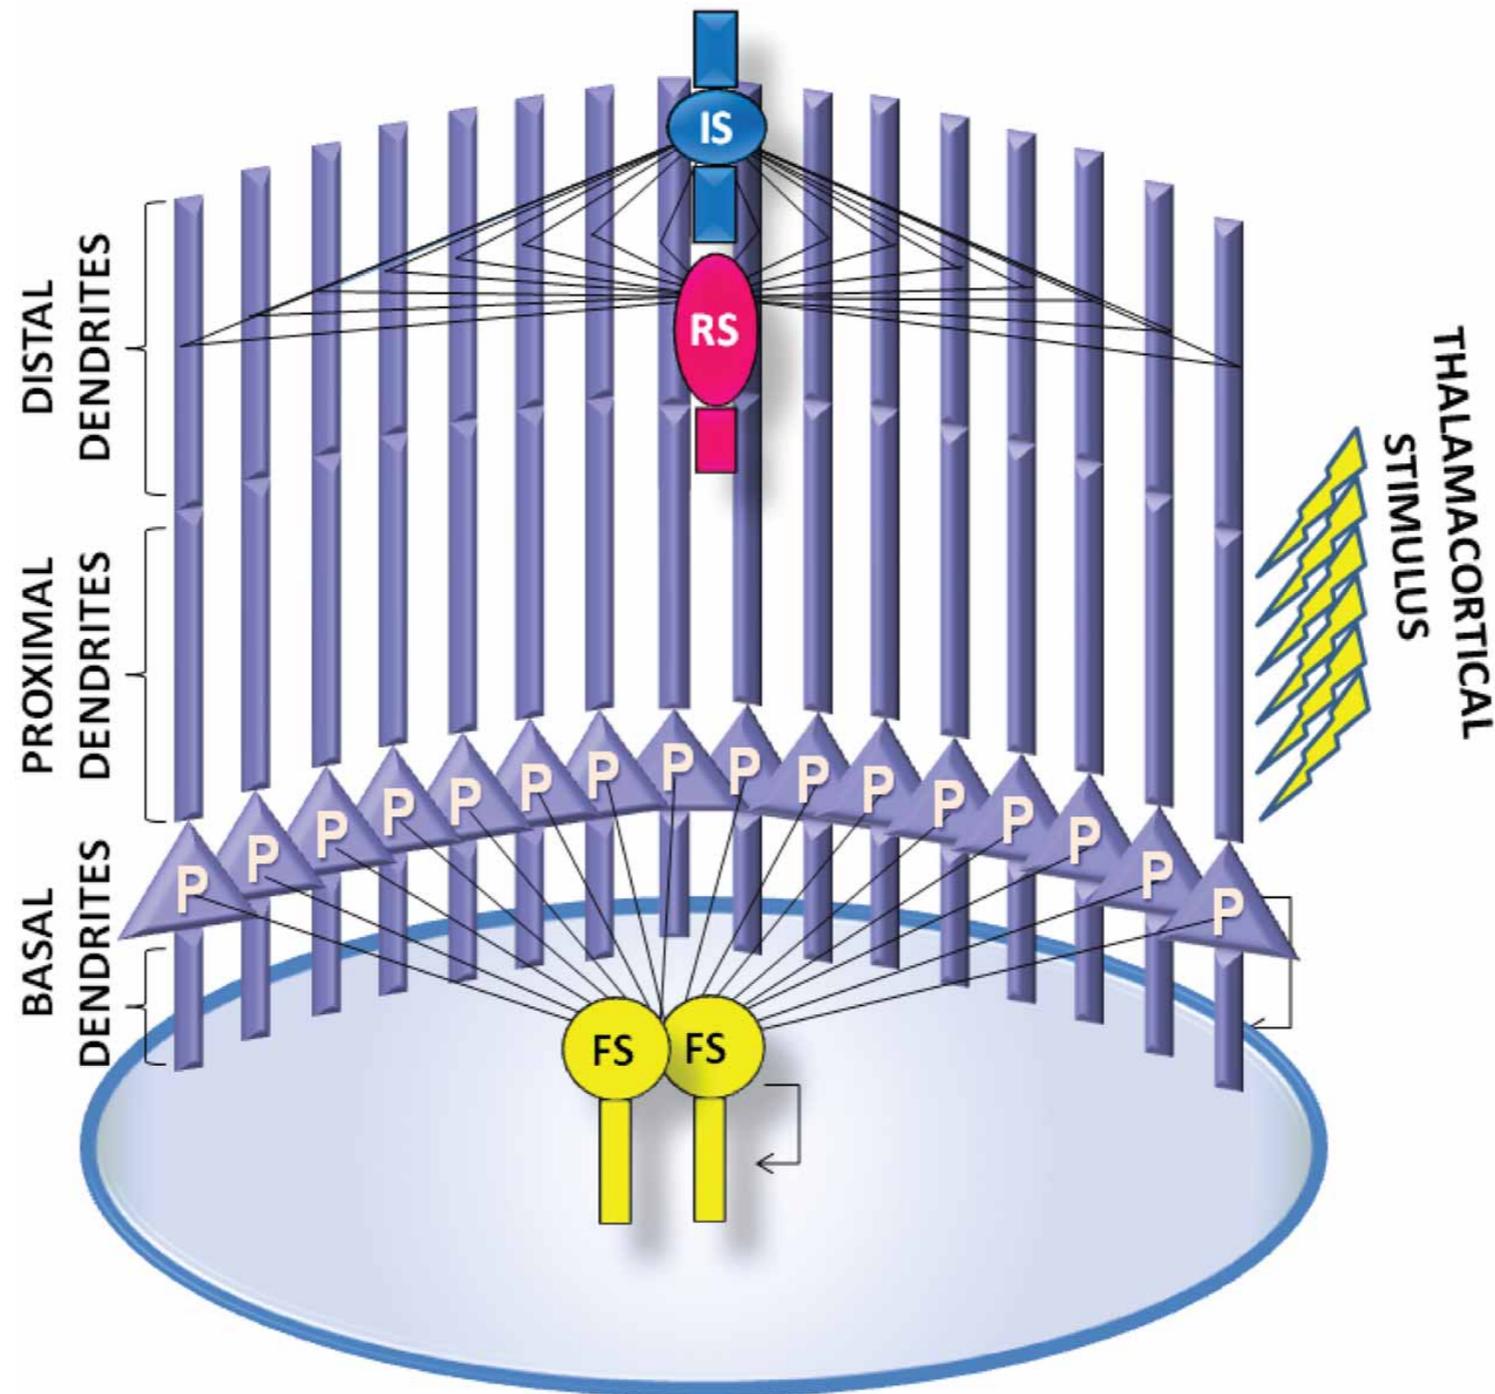

Αποκλινόμενα νευρωνικά δίκτυα

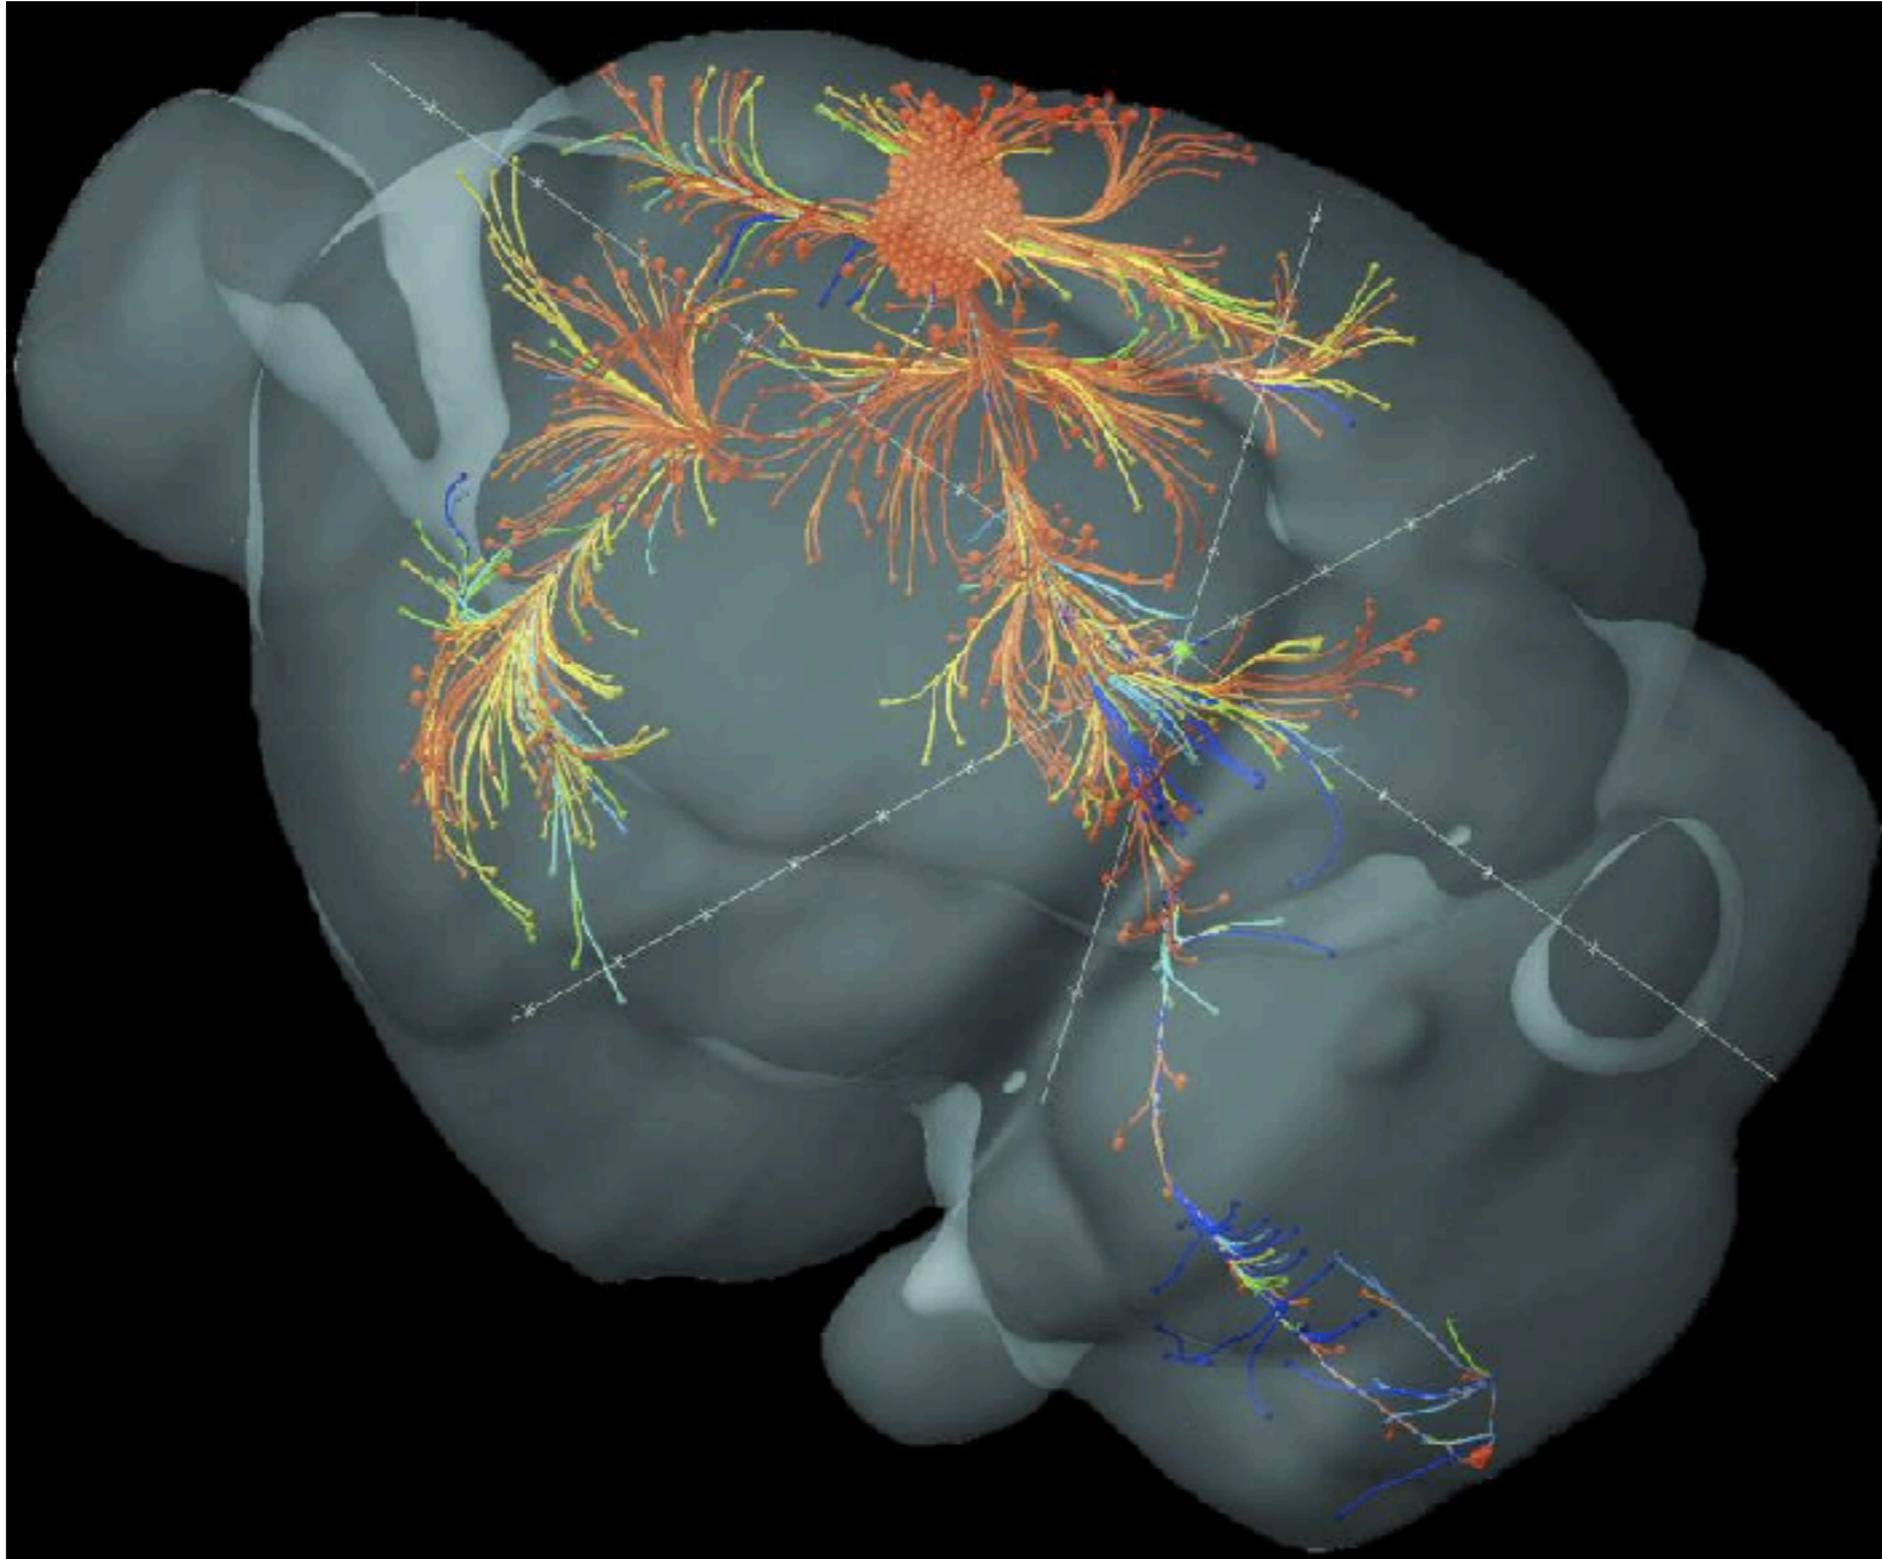

Orthodromic excitation Somatosensory system

Recurrent excitation and inhibition

Connectome

Why do we want to study networks in the brain?

- The function of neuronal networks underlies all animal behavior

How can we study neuronal networks that underlie behaviour?

- **Types of behaviour**

- Feeding
- Exploration
- Perception
- Learning
- Memory recall
- Rule learning

How can we study neuronal networks that underlie behaviour?

- Study neurons that are activated during a specific behavior
 - Action potentials - electrophysiological/ imaging
 - Synaptic activity - electrophysiological
 - markers of activity
 - Correlate their activity with specific aspects of behavior
- Manipulate their activity and study the effect on behavior
 - optogenetics

How can we study neuronal networks that underlie behaviour?

- Study cellular correlates of behavior
 - Persistent activity for working memory
 - Long-term potentiation for long-term memory
- Study neurons that are activated during a specific behavior
 - Action potentials - electrophysiological/ imaging
 - Synaptic activity - electrophysiological
 - markers of activity
- Correlate their activity with specific aspects of behavior
- Manipulate their activity and study the effect on behavior
 - optogenetics

How can we study neuronal networks that underlie behaviour?

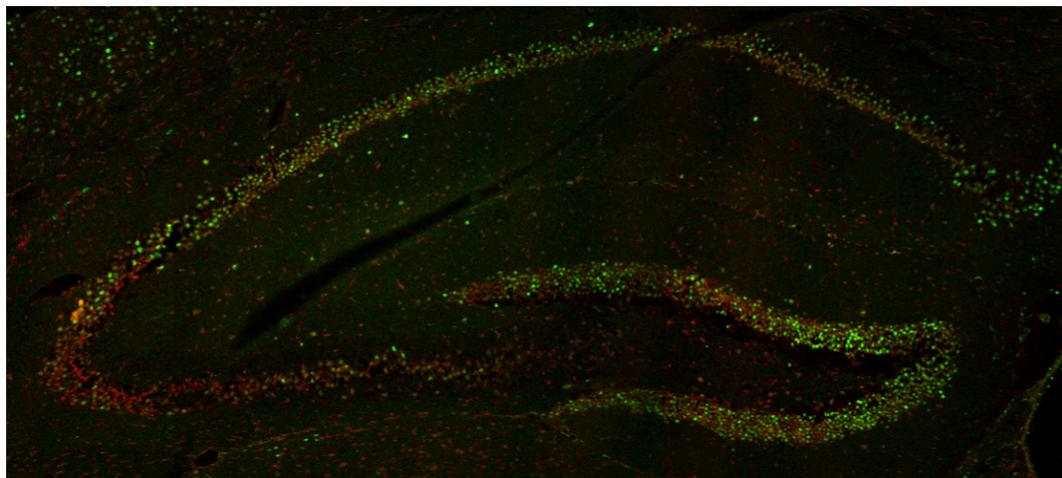

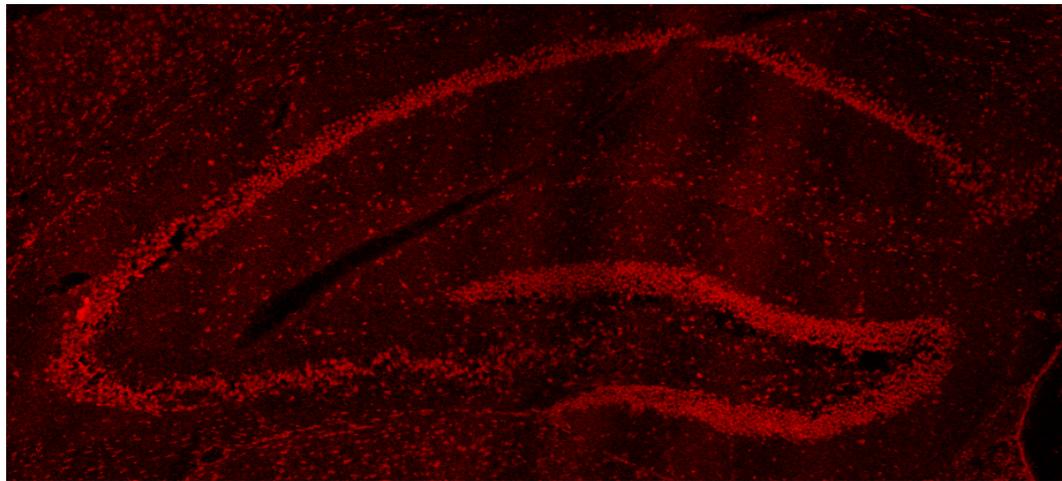

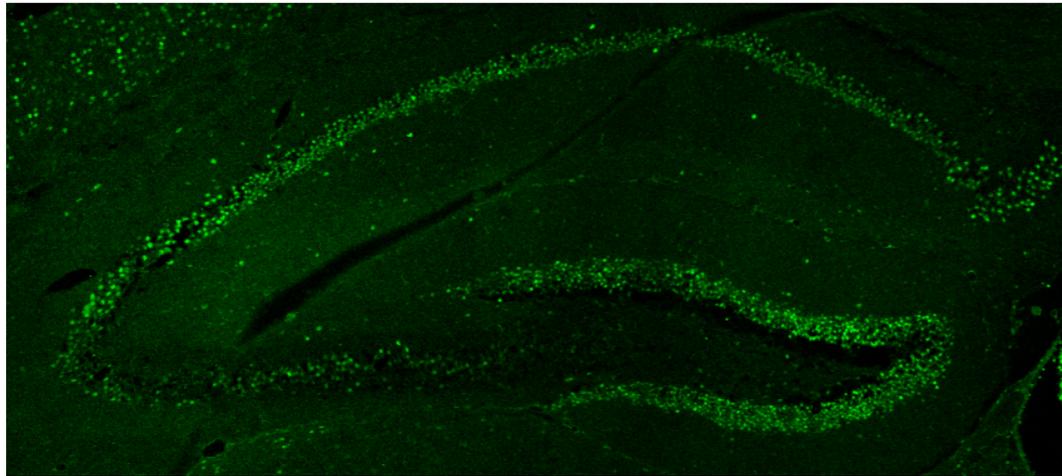

- Study cellular correlates of behavior
 - Persistent activity for working memory
 - Long-term potentiation for long-term memory
- Study neurons that are activated during a specific behavior
 - Action potentials - electrophysiological/ imaging
 - Synaptic activity - electrophysiological
 - **markers of activity**
- Correlate their activity with specific aspects of behavior
- Manipulate their activity and study the effect on behavior
 - optogenetics

Cellular and molecular techniques

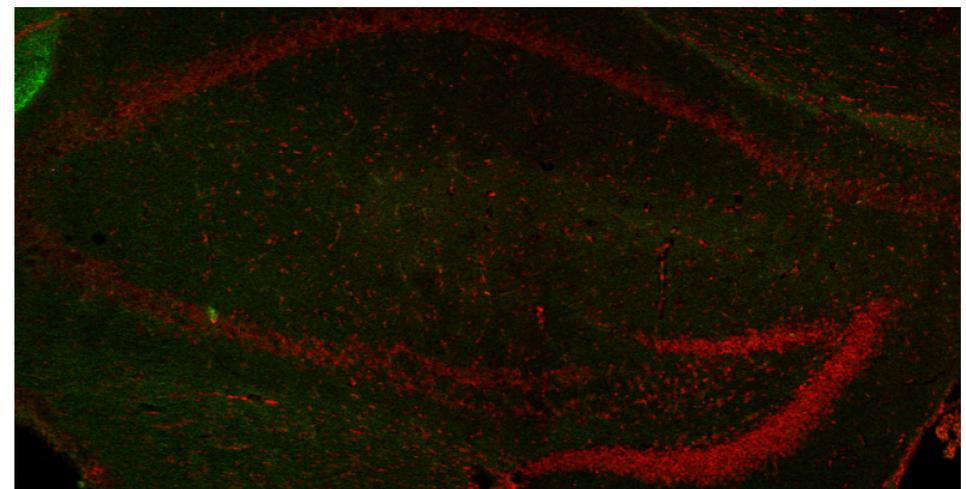

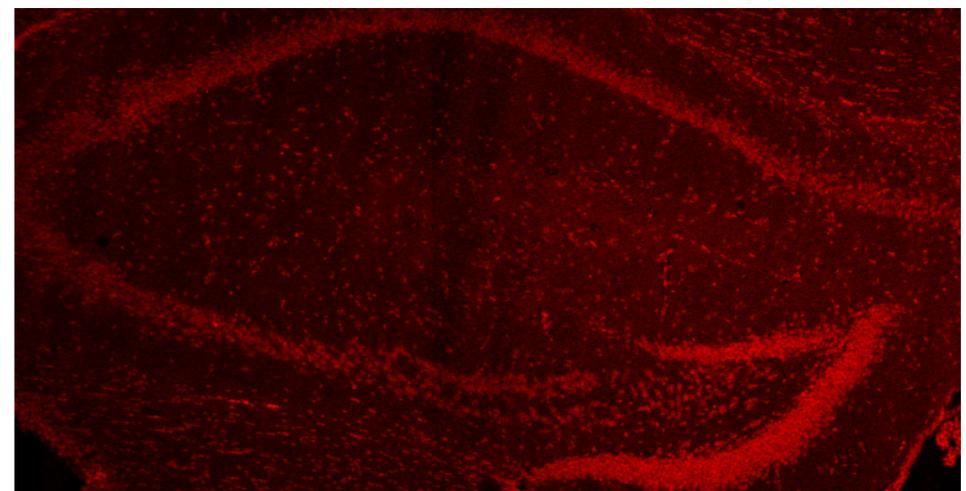

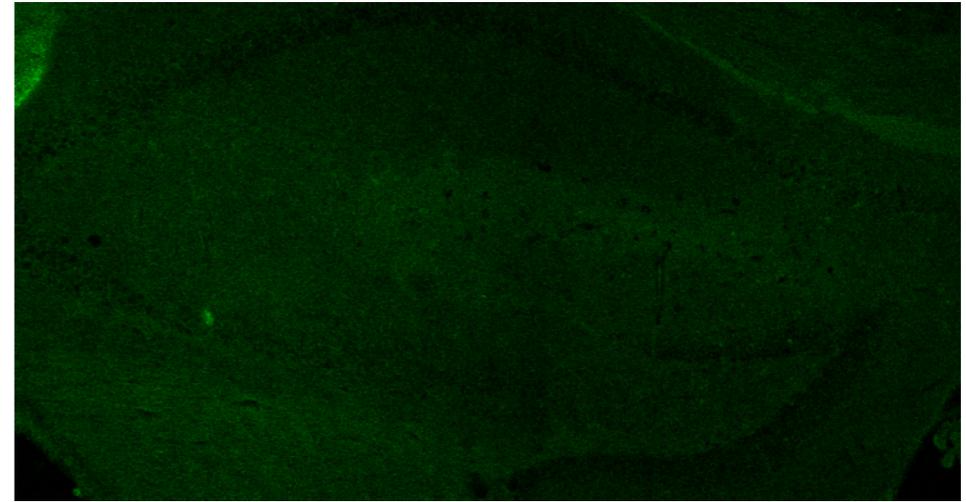

- Immediate early genes - Activity markers
 - Arc
 - c-fos
 - c-jun
- Genes that are transcribed and translated in response to neuronal activity

c-fos activation following epileptic seizures

WT mouse, 300mg/kg pilocarpine

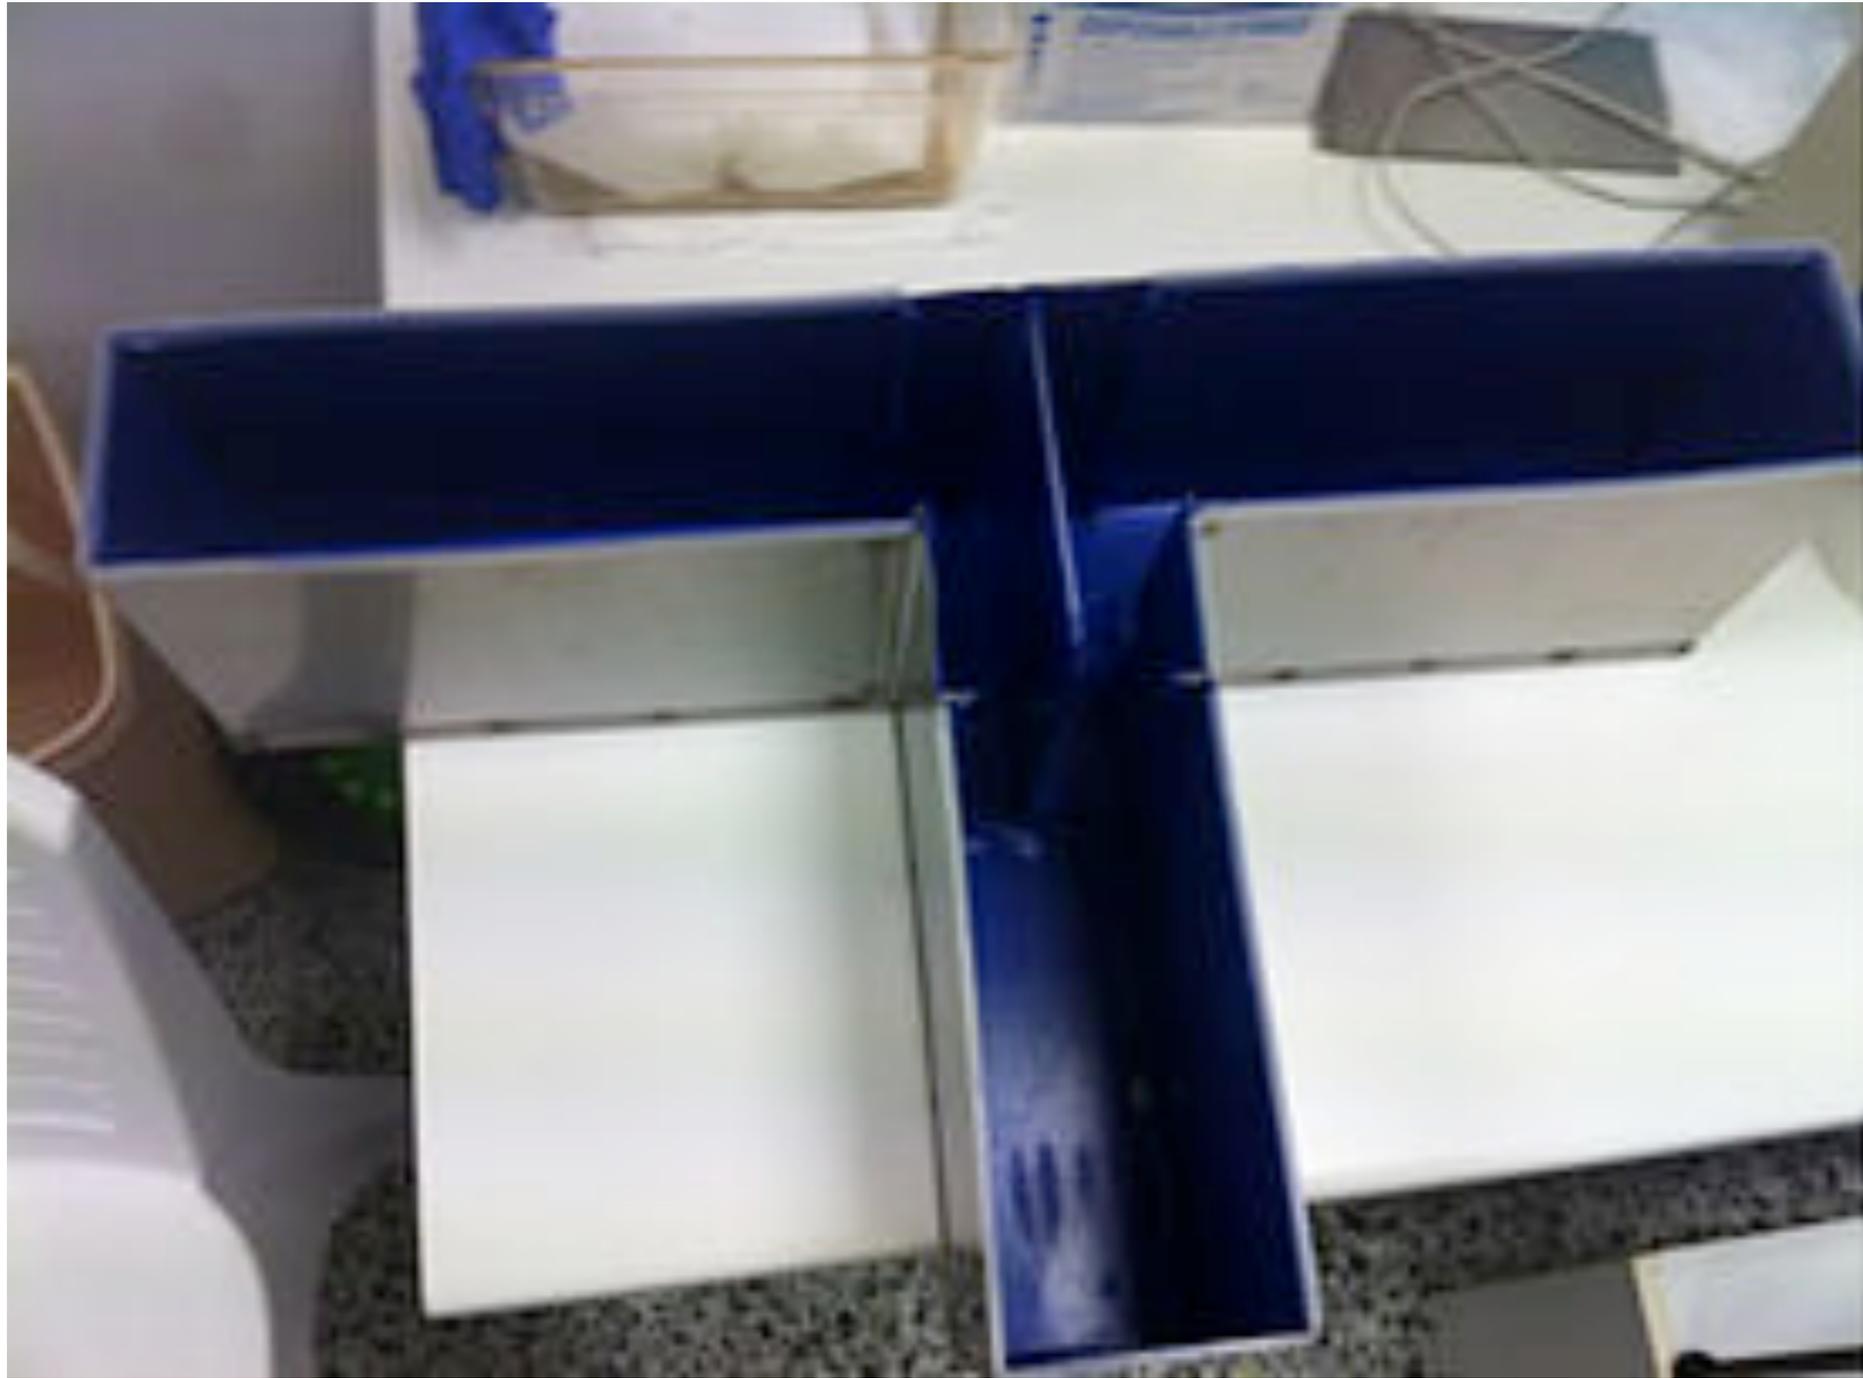

Rac1 conditional KO mouse
100mg/kg pilocarpine

Chalkiadaki, Sidiropoulou, unpublished data

Different types of memory behavior in the T-maze

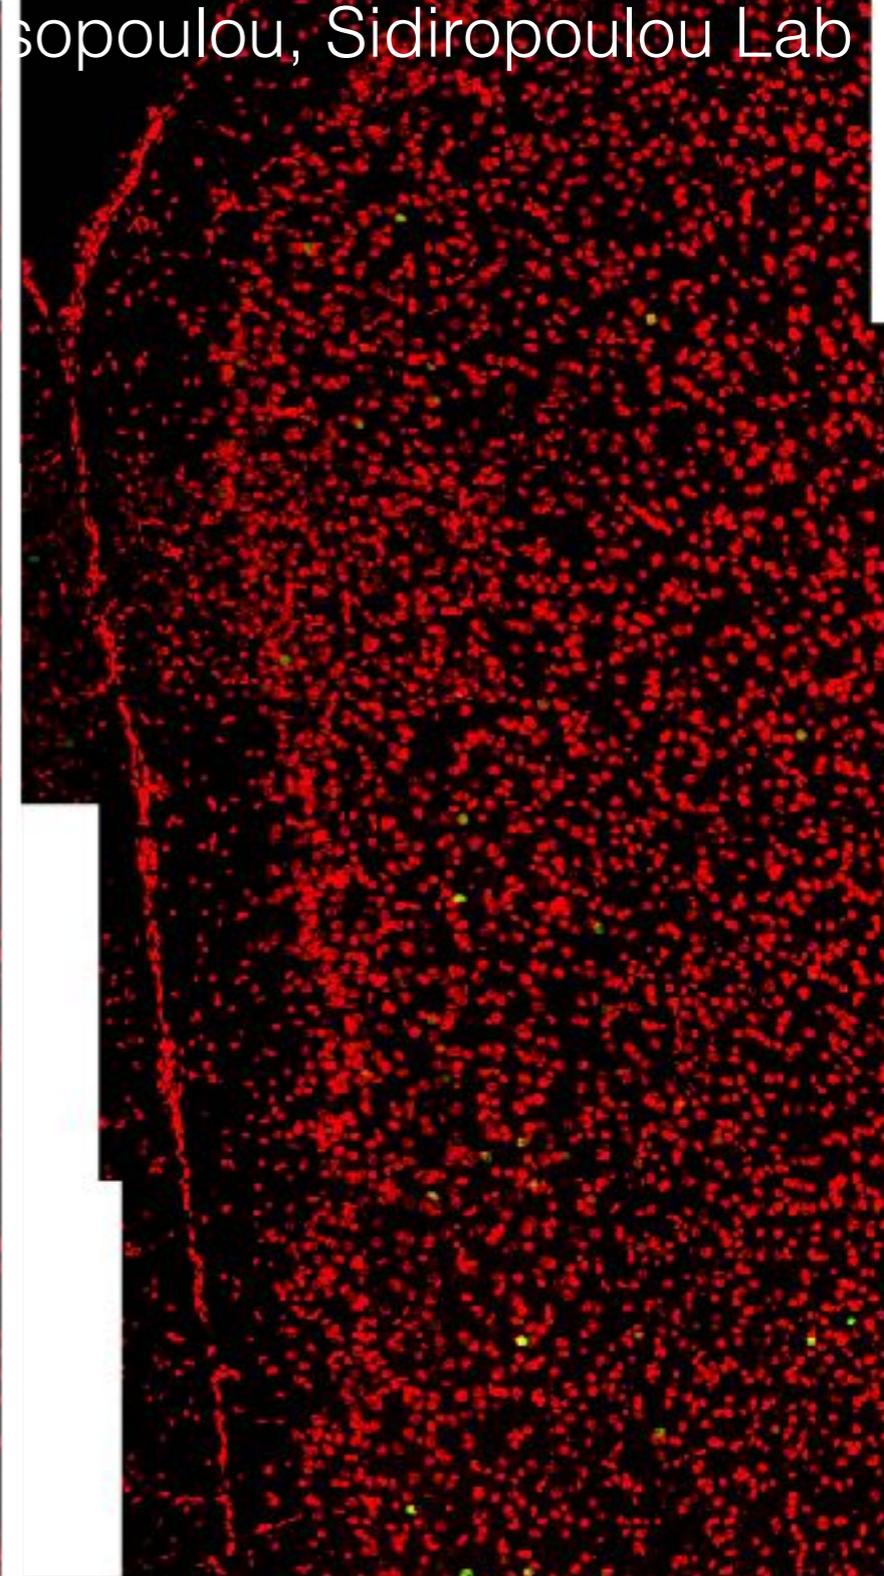

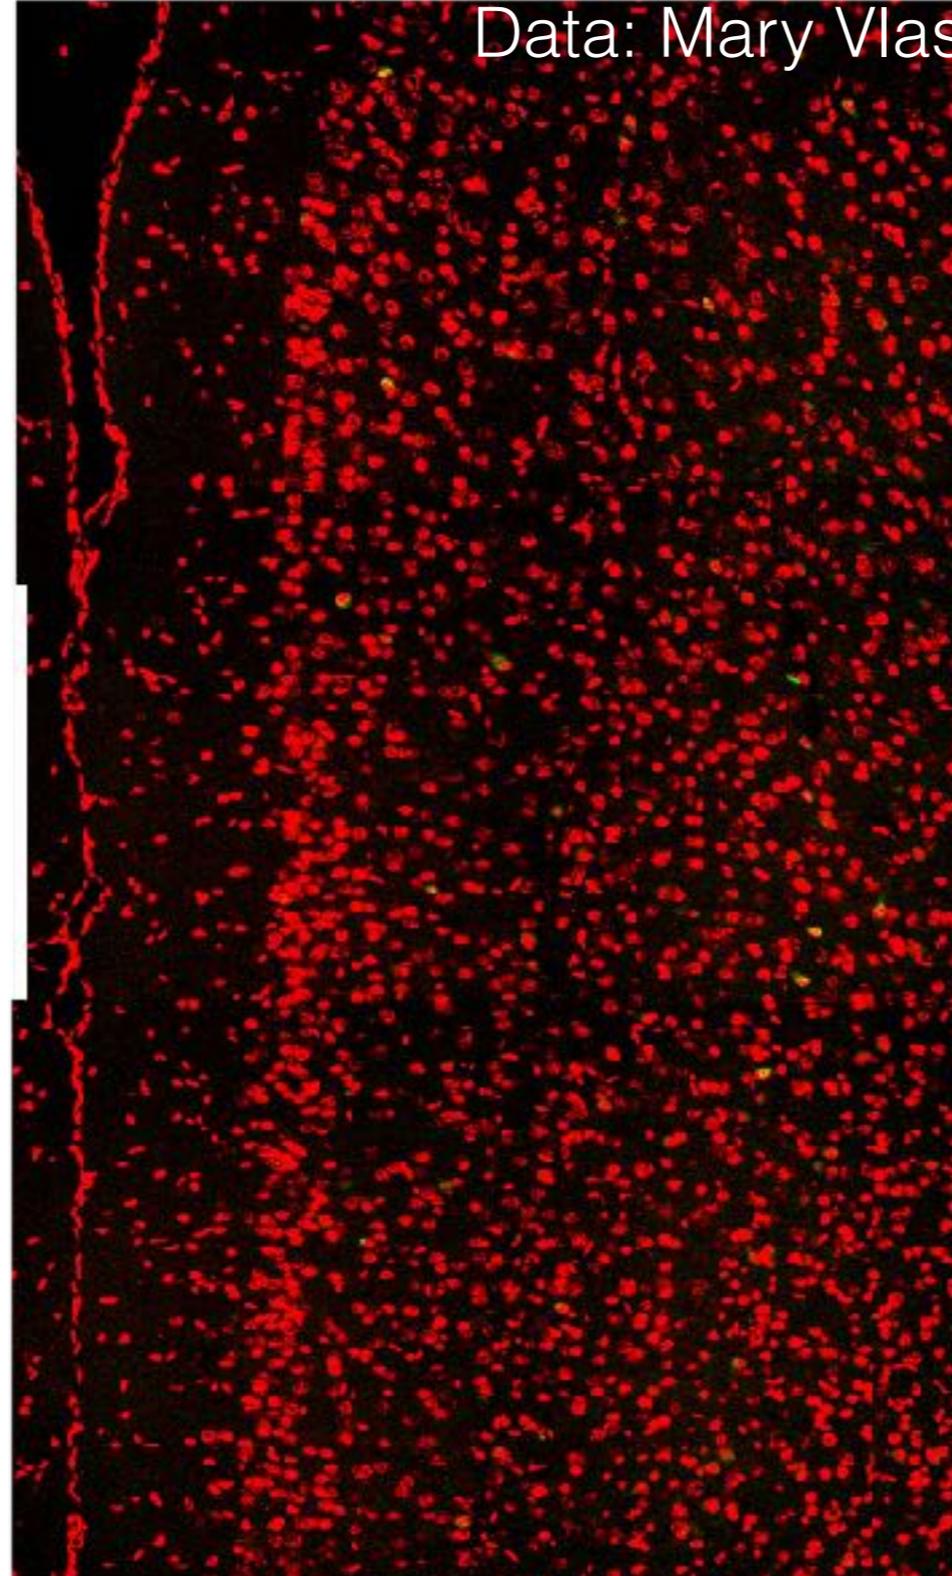

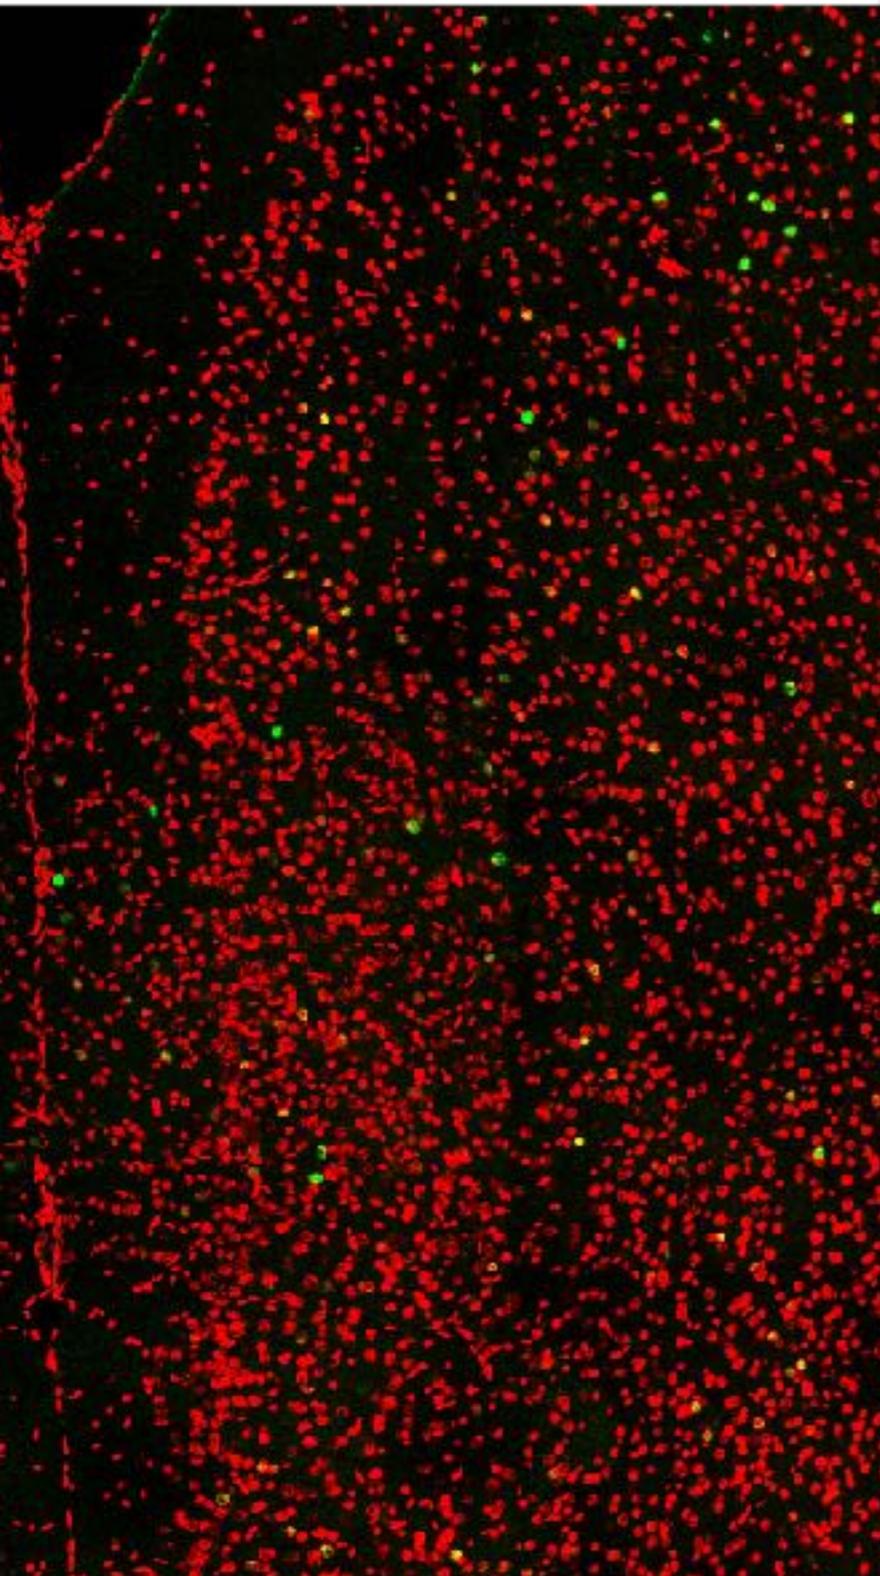

PREFRONTAL CORTEX

Delayed alternation

Left-Right discrimination

Open-Field

Data: Mary Vlassopoulou, Sidiropoulou Lab

D

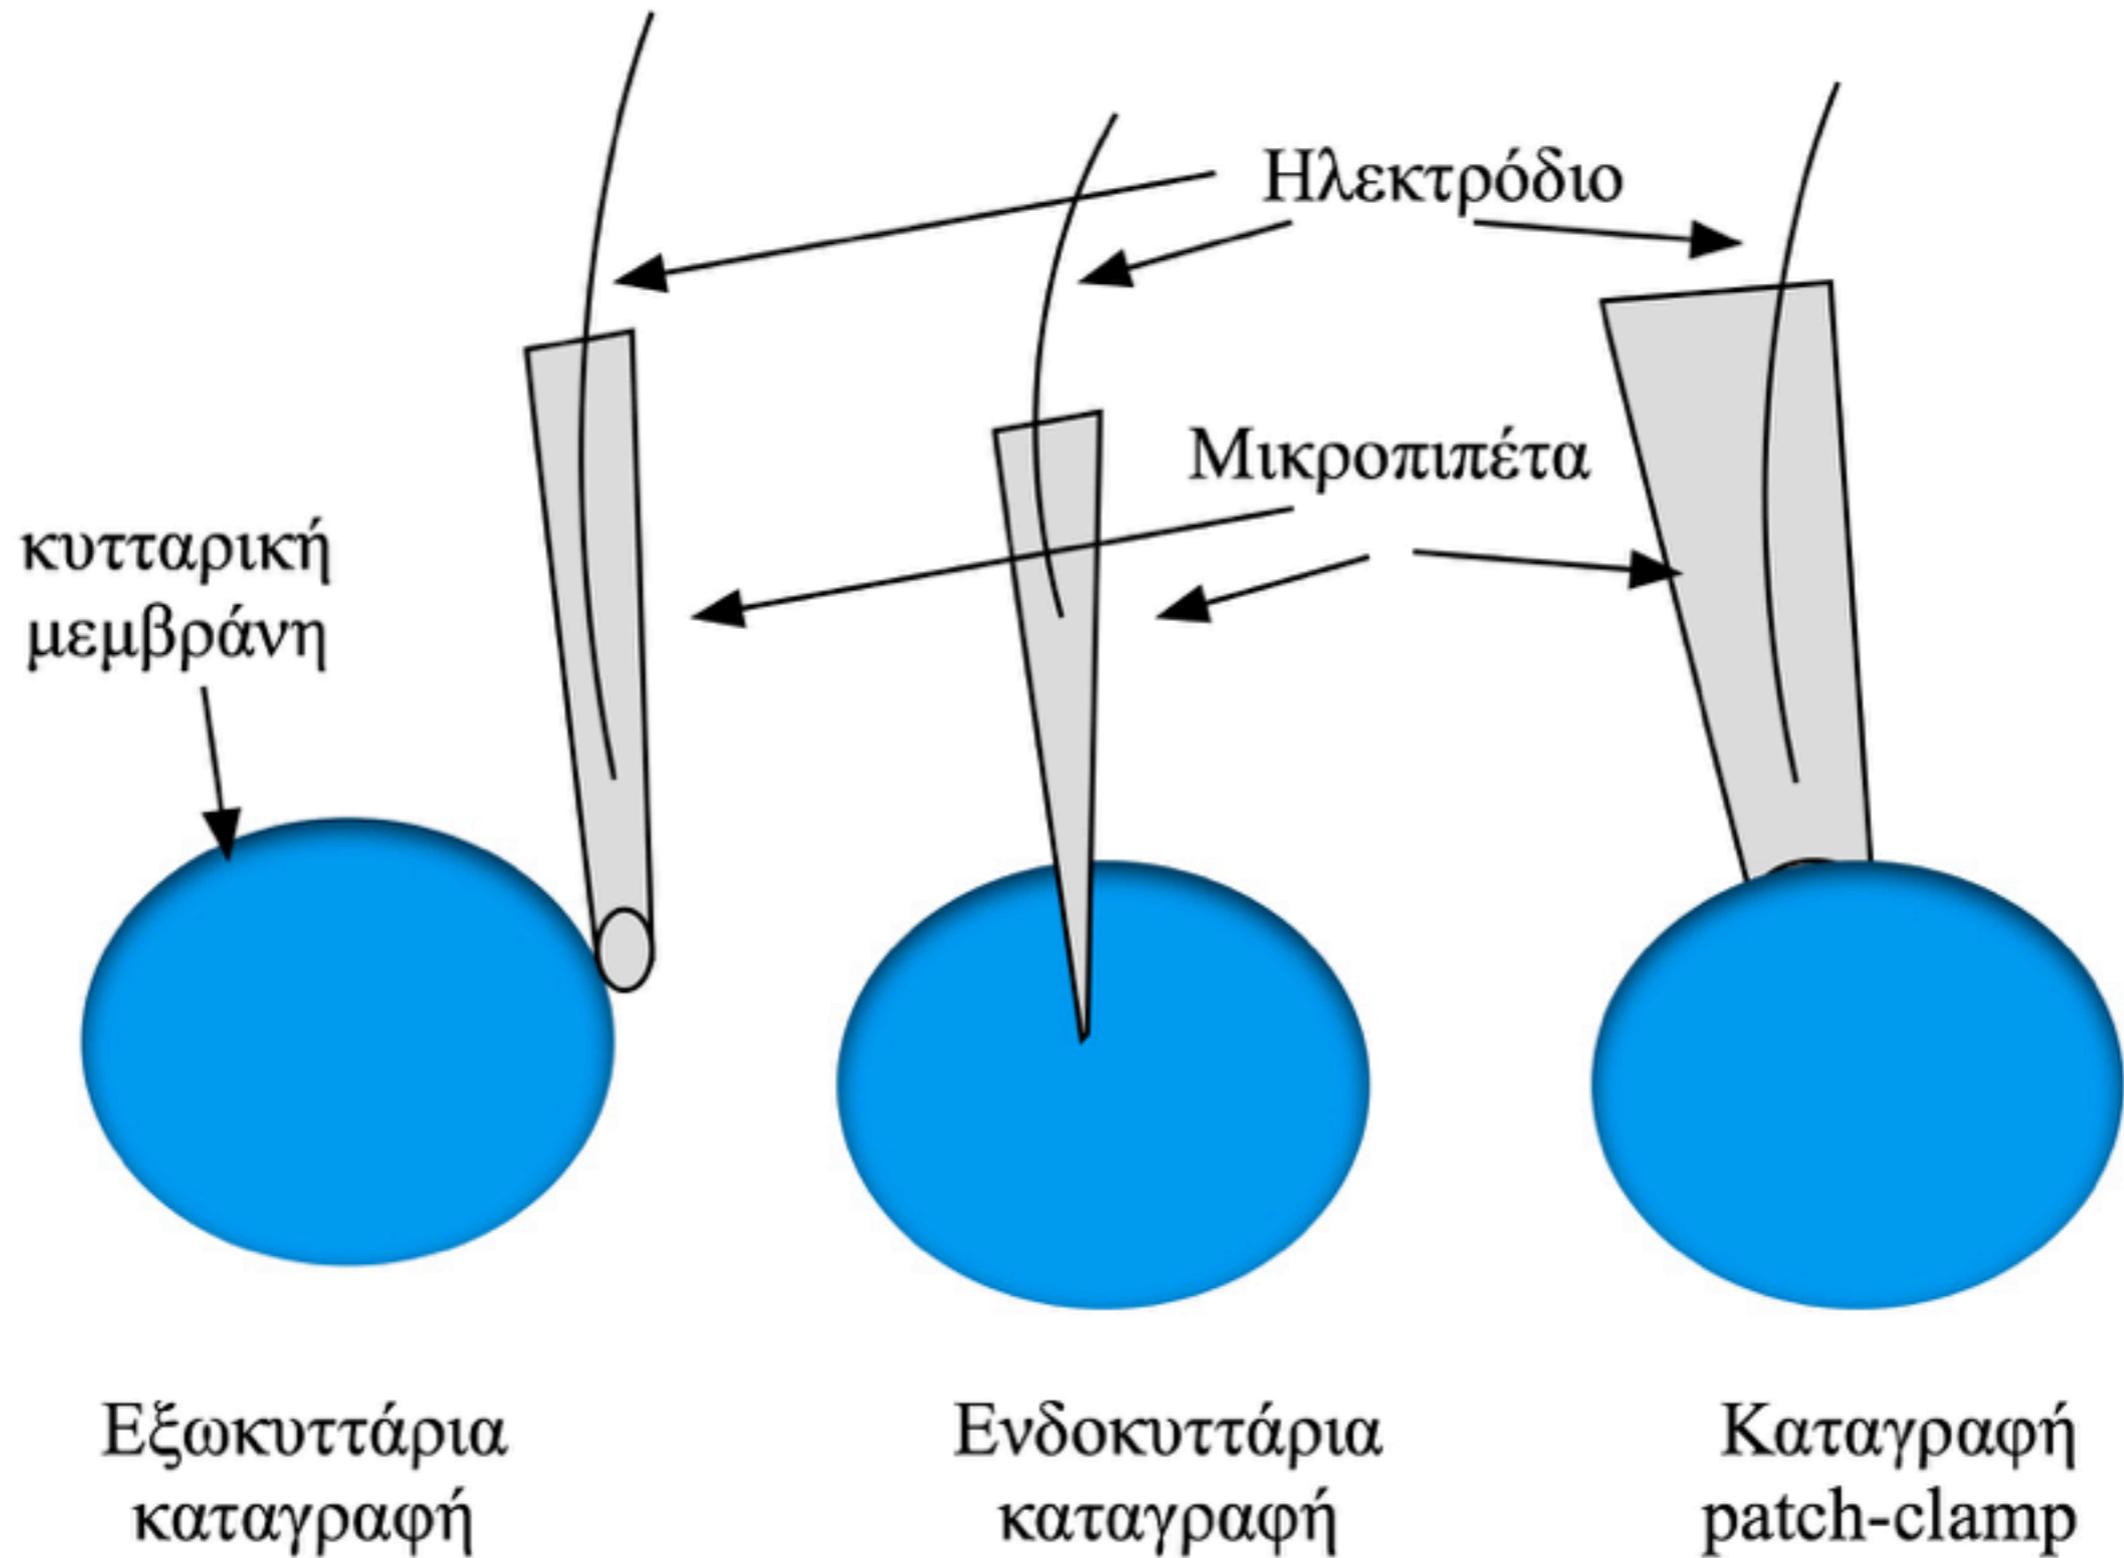

Correlation networks that underlie memory recall

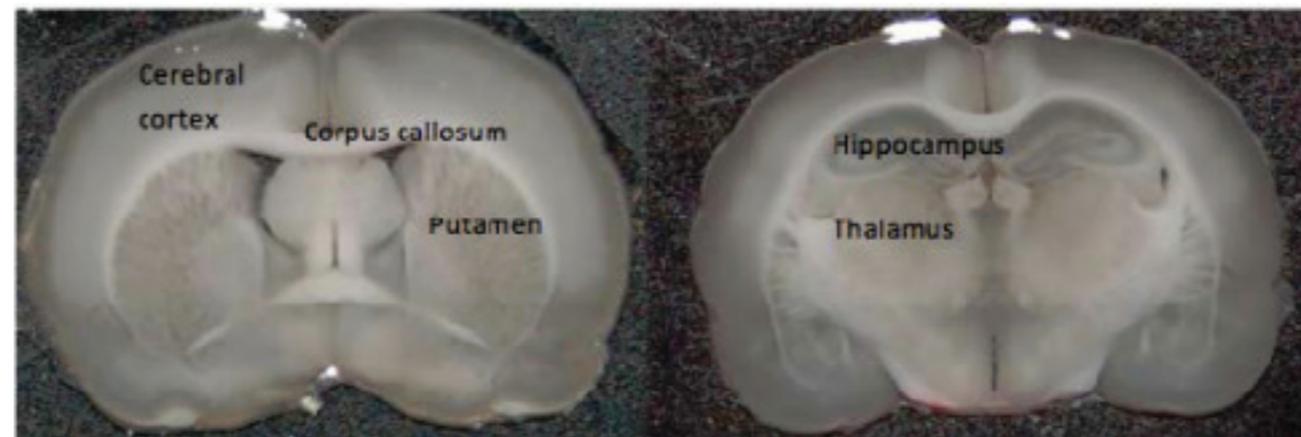

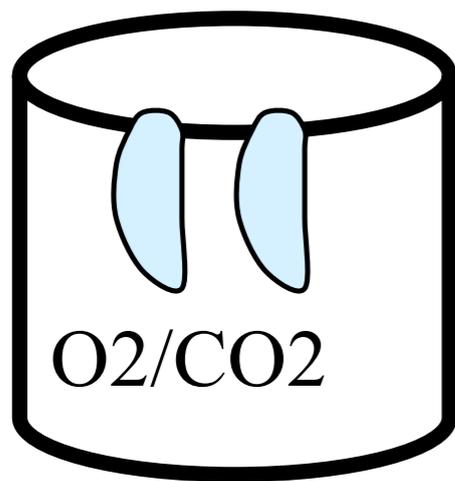

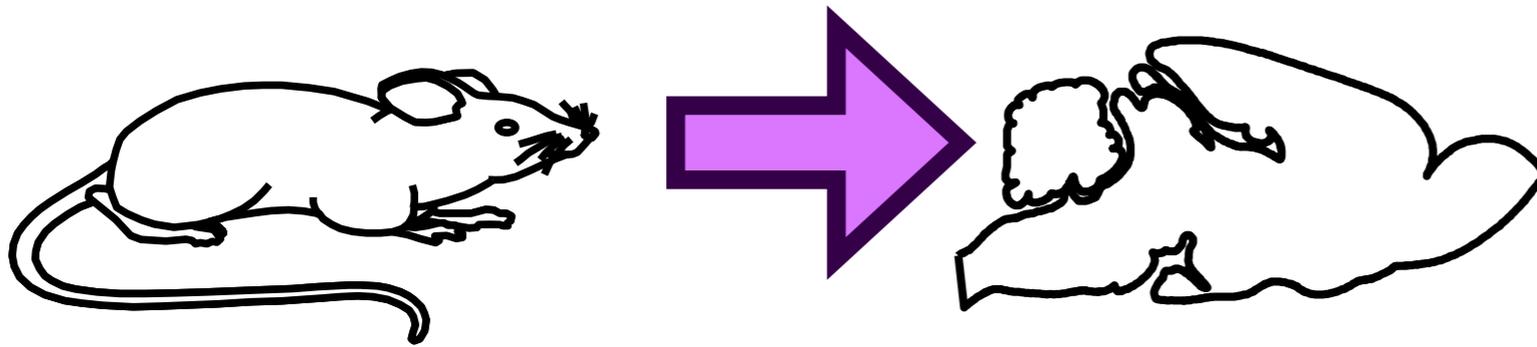

How can we study neuronal networks that underlie behaviour?

- Study cellular correlates of behavior
 - Persistent activity for working memory
 - Long-term potentiation for long-term memory
- Study neurons that are activated during a specific behavior
 - **Action potentials - electrophysiological/ imaging**
 - **Synaptic activity - electrophysiological**
 - markers of activity
- Correlate their activity with specific aspects of behavior
- Manipulate their activity and study the effect on behavior
 - optogenetics

Electrophysiological recordings

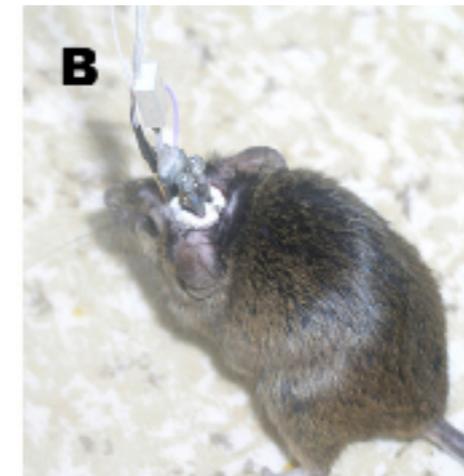

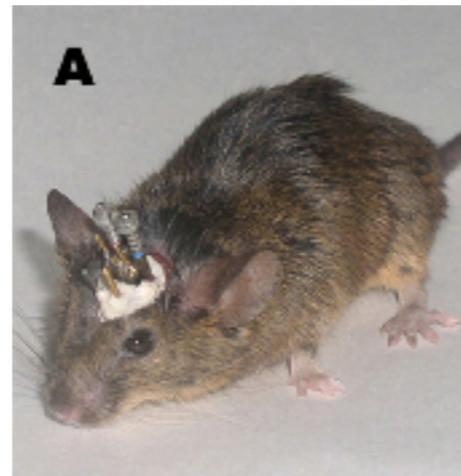

Acute brain slice

In vivo recordings

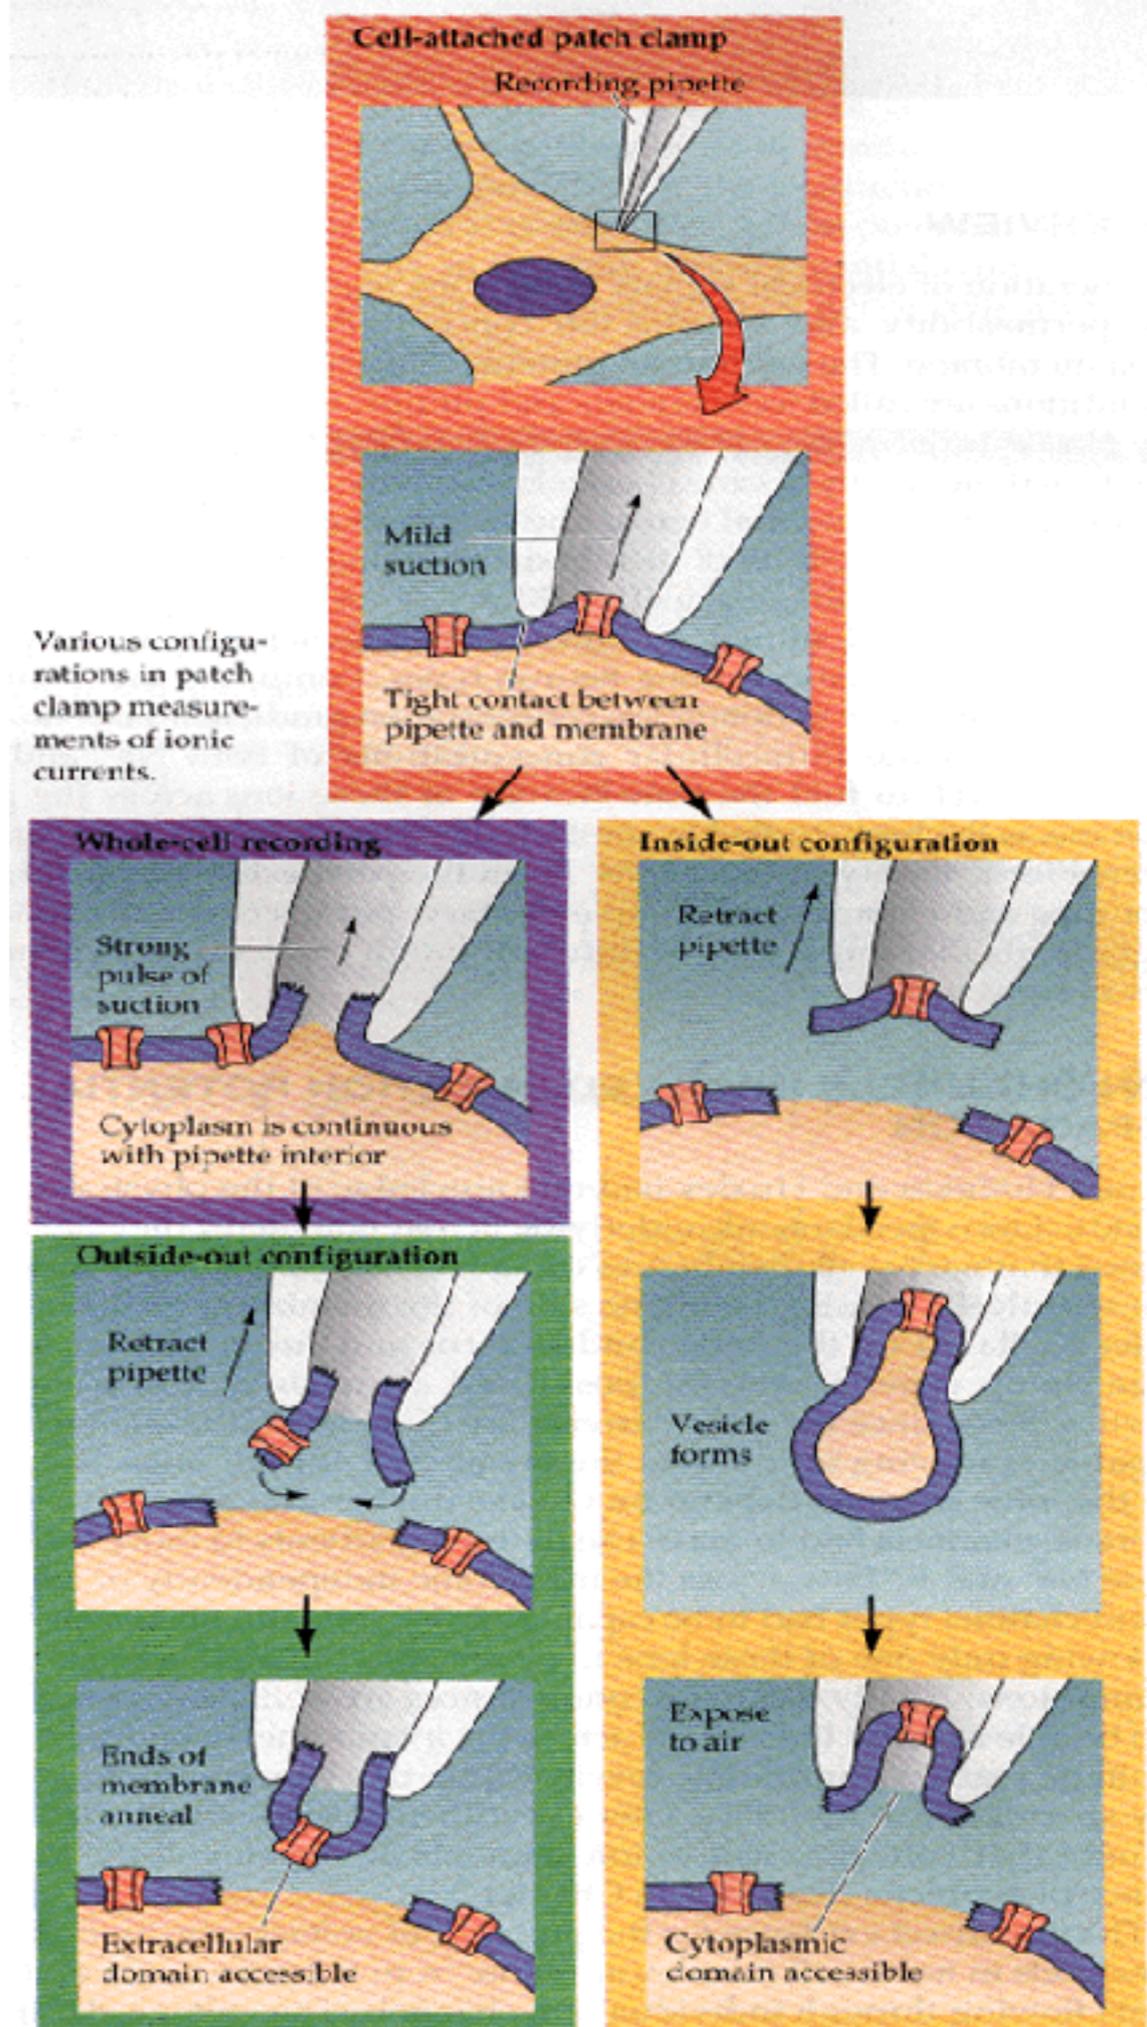

- Anaesthetized
- Head-fixed
- Freely-moving

Intracellular or patch-clamp recordings

Patch clamp technique Configurations

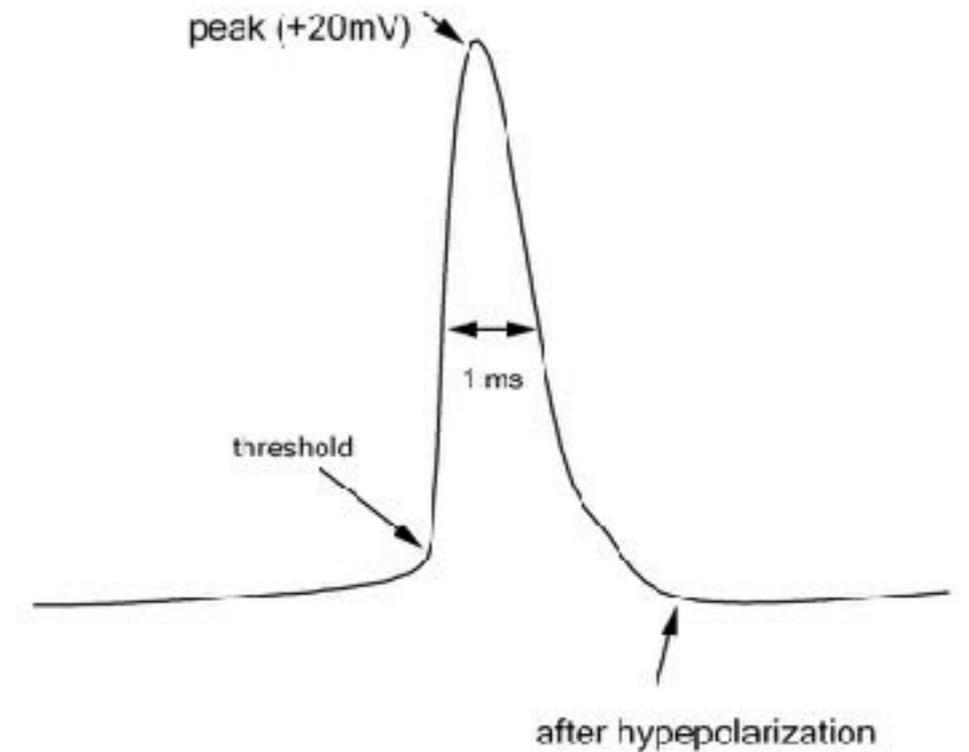

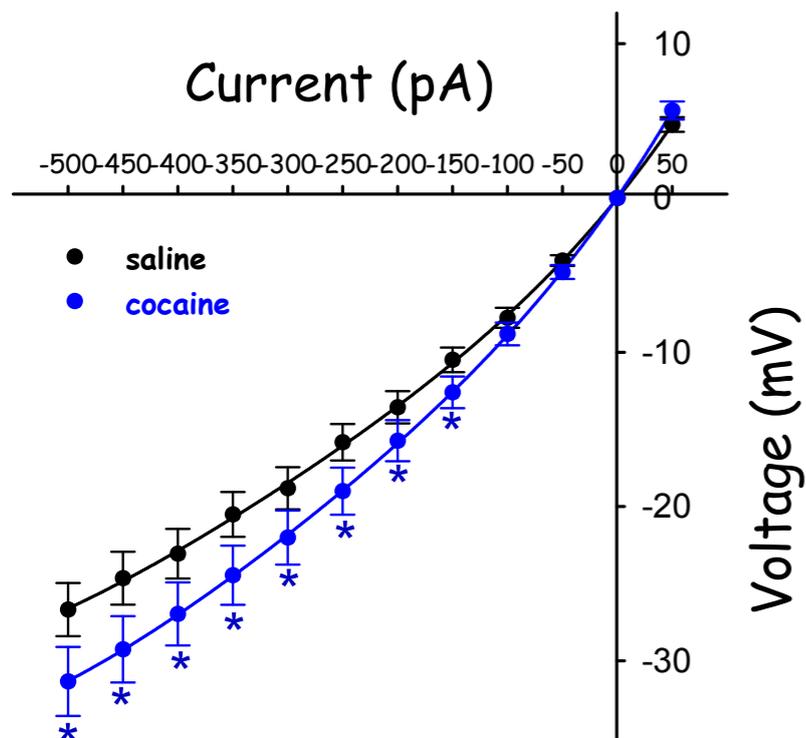

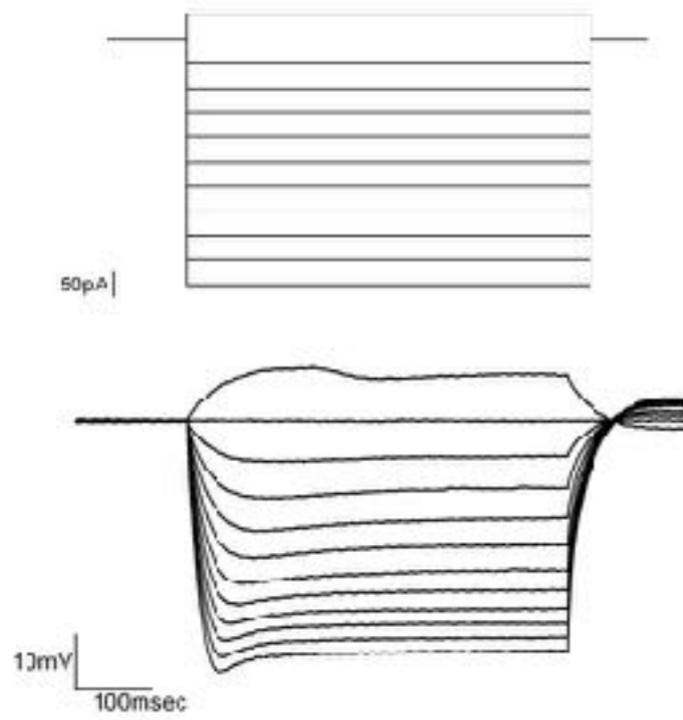

- Current-clamp
 - Give current inputs and record voltage changes
 - Monitor V_m , record Action Potentials
- Voltage-clamp mode
 - “Clamp” voltage and record currents
 - Study different ion channels

- I-V curve
- Membrane properties

Current-clamp

- Action potential properties

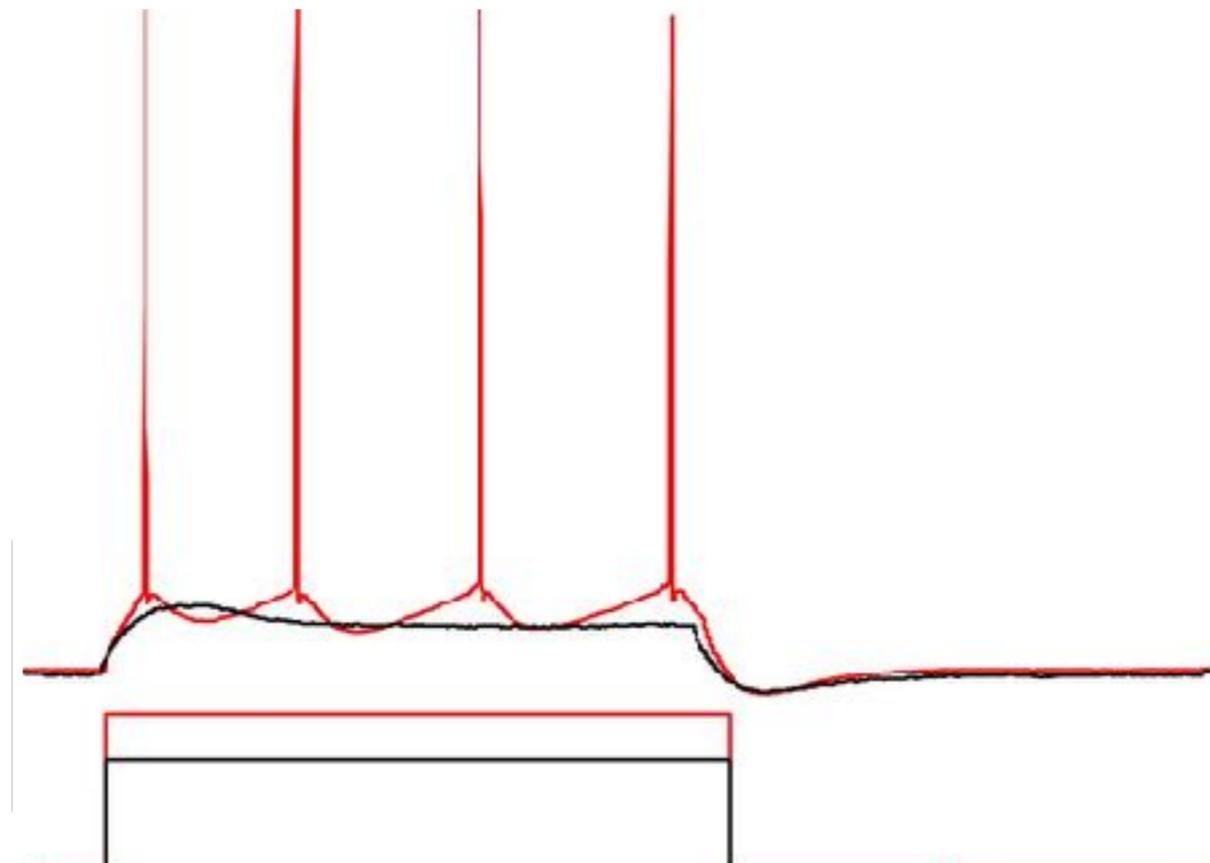

Whole-cell configuration Current-clamp

Διαλύματα που χρησιμοποιούνται

Εξωκυττάρια: τεχνητό εγκεφαλονωτιαίο υγρό (artificial cerebrospinal fluid, aCSF), pH,

Ενδοκυττάρια (στο ηλεκτρόδιο): παρόμοια με το ενδοκυττάριο περιβάλλον

Voltage response
Current input

Voltage-clamp

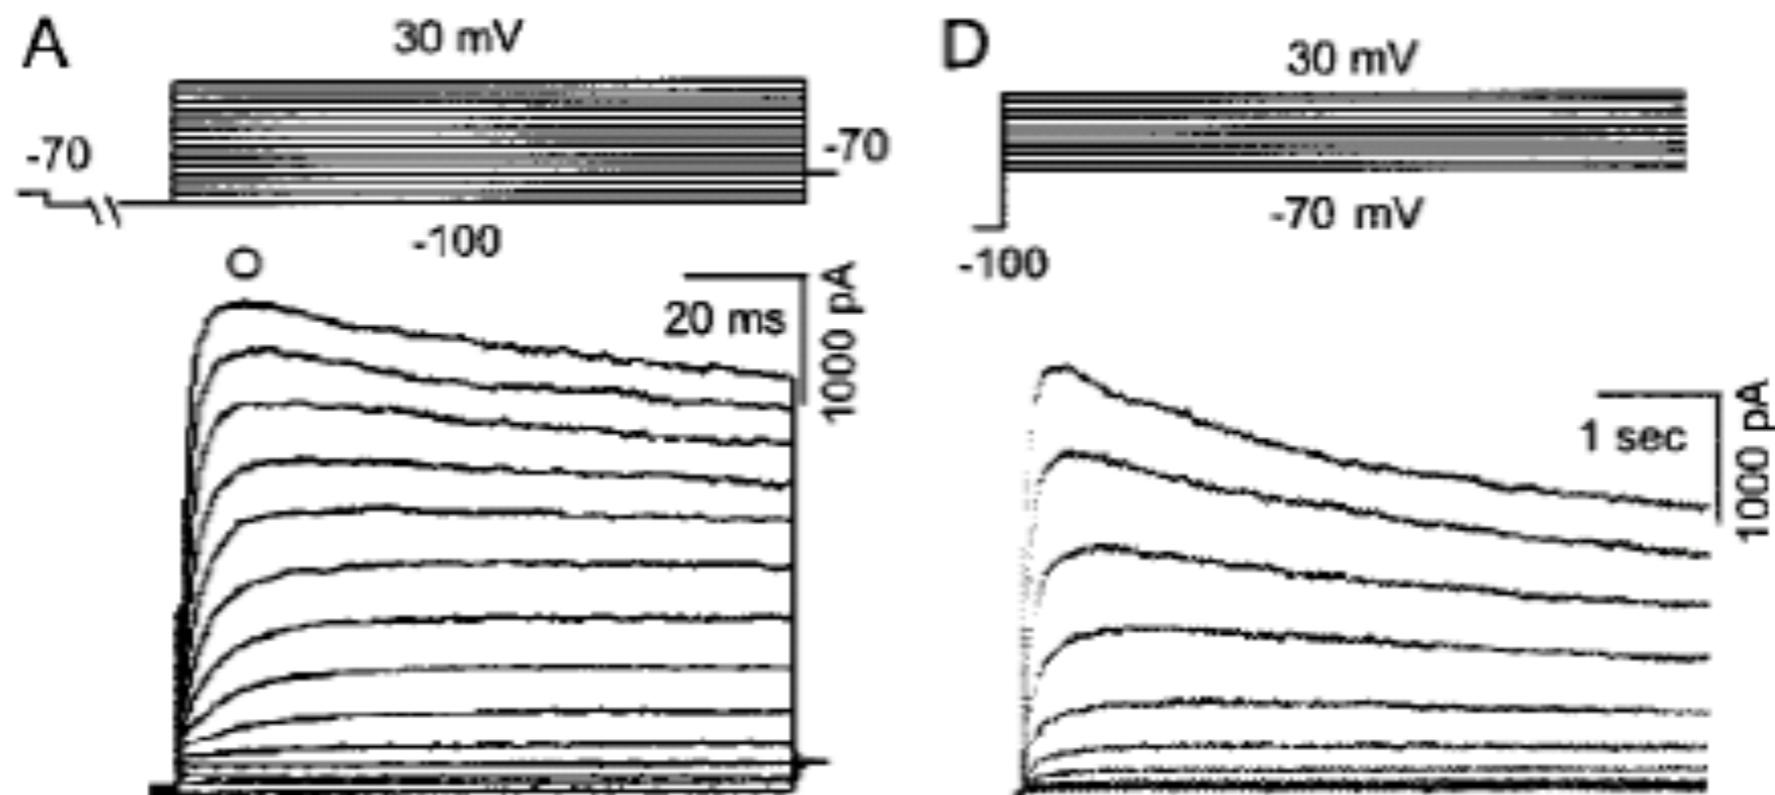

- Διαλύματα (ανάλογα με το ρεύμα που είναι να καταγραφεί)
- Τα περιεχόμενα των διαλυμάτων μπορούν να επηρεάσουν κατά πολύ τα αποτελέσματα των καταγραφών.

Current recordings

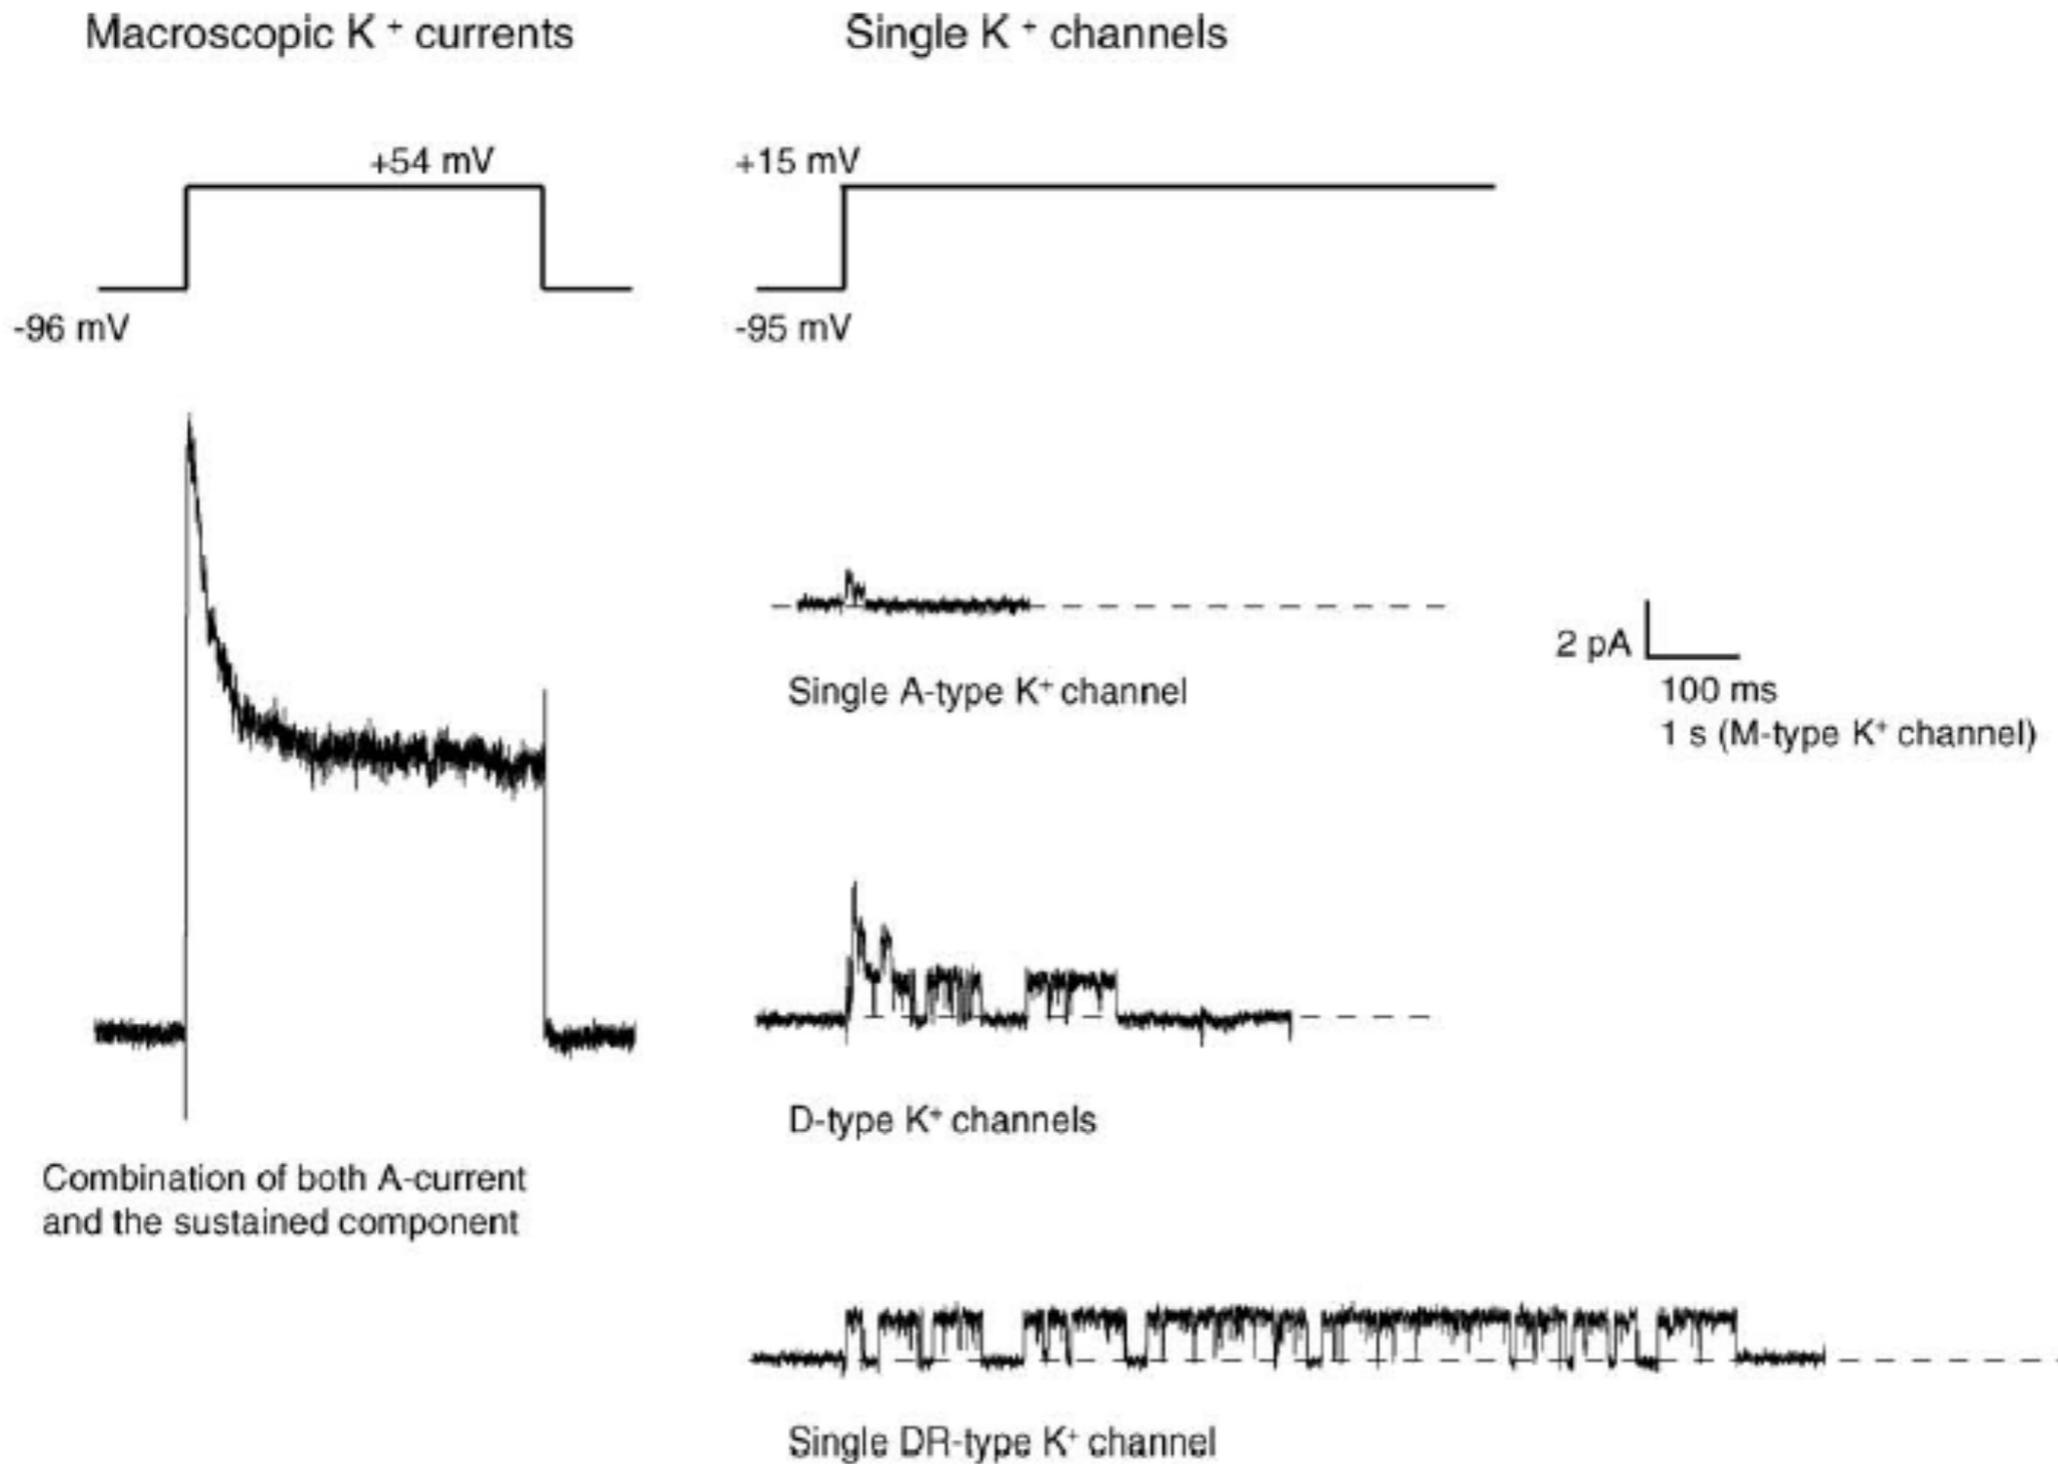

- Ρεύμα νατρίου (μπλοκάρουμε τα ρεύματα καλίου και ασβεστίου)
- Ρεύμα καλίου (μπλοκάρουμε τα ρεύματα νατρίου και ασβεστίου)
- Ρεύμα ασβεστίου (μπλοκάρουμε τα ρεύματα νατρίου και καλίου)

Tetradotoxin, tetra-ethyl-ammonium (TEA), cadmium

Potassium currents voltage-dependent (whole-cell configuration)

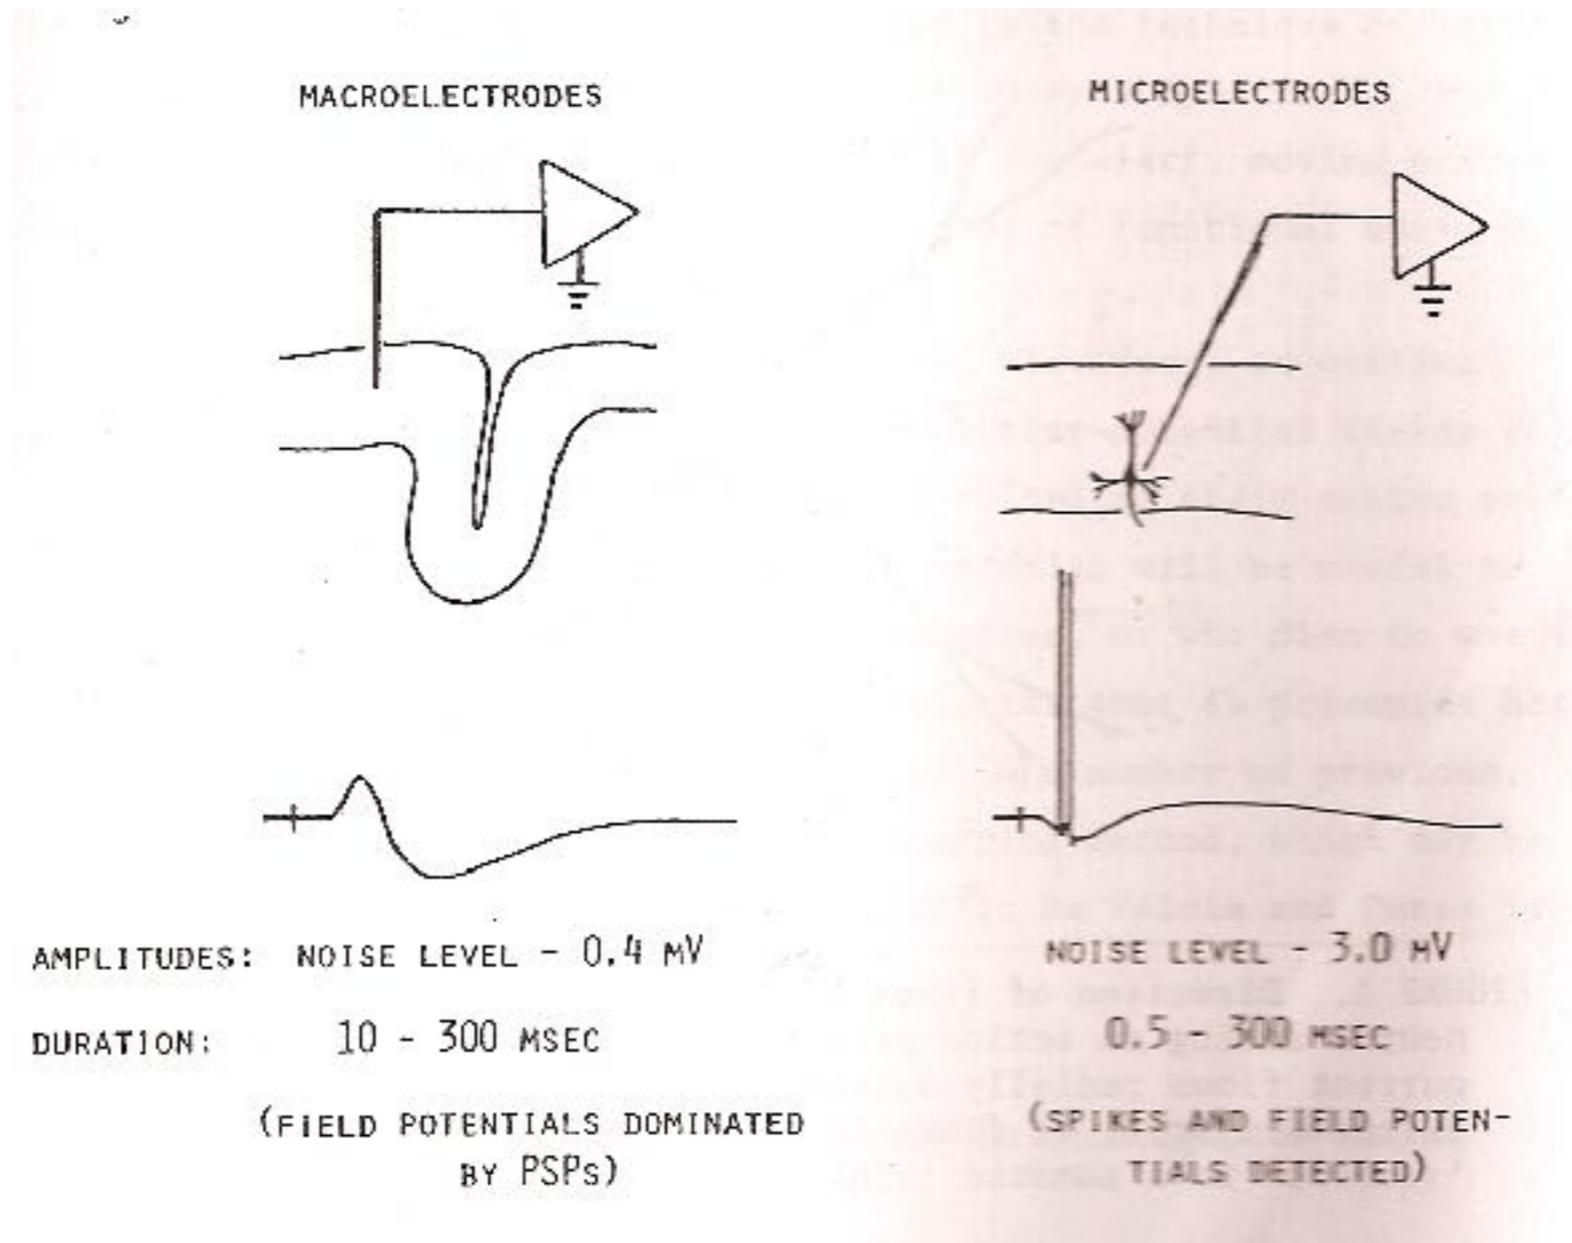

Whole-cell vs single-channel currents

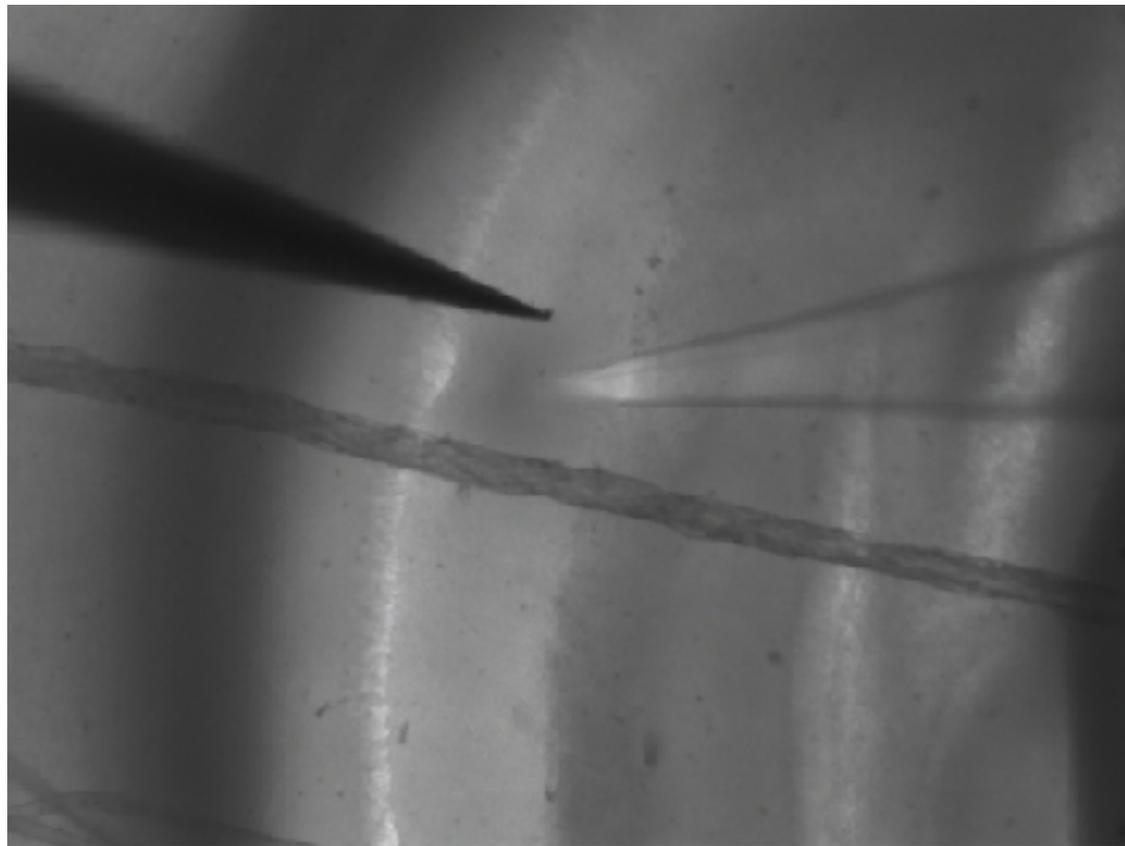

What is the connection to networks and behavior?

Extracellular recordings

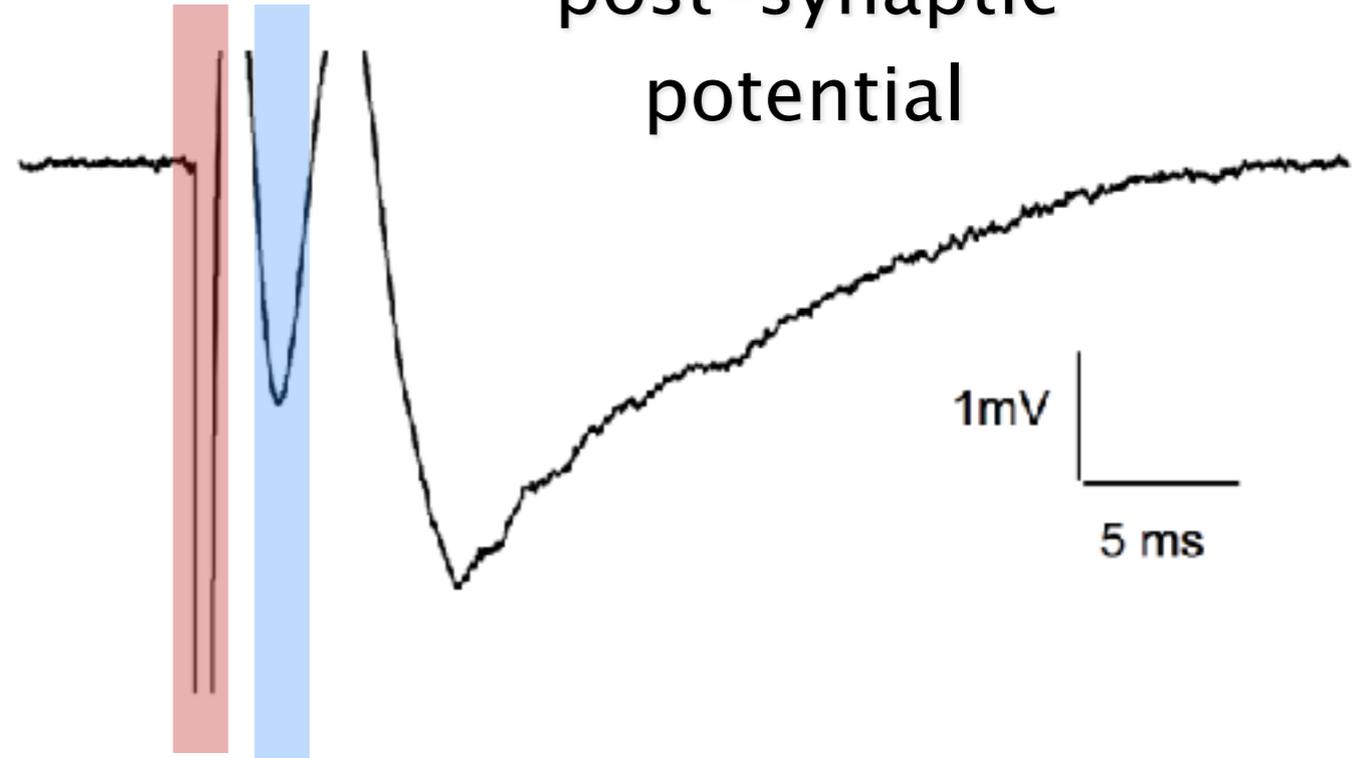

Mountcastle, 1957

Extracellular Recordings - Local Field Potentials

stimulation
artifact

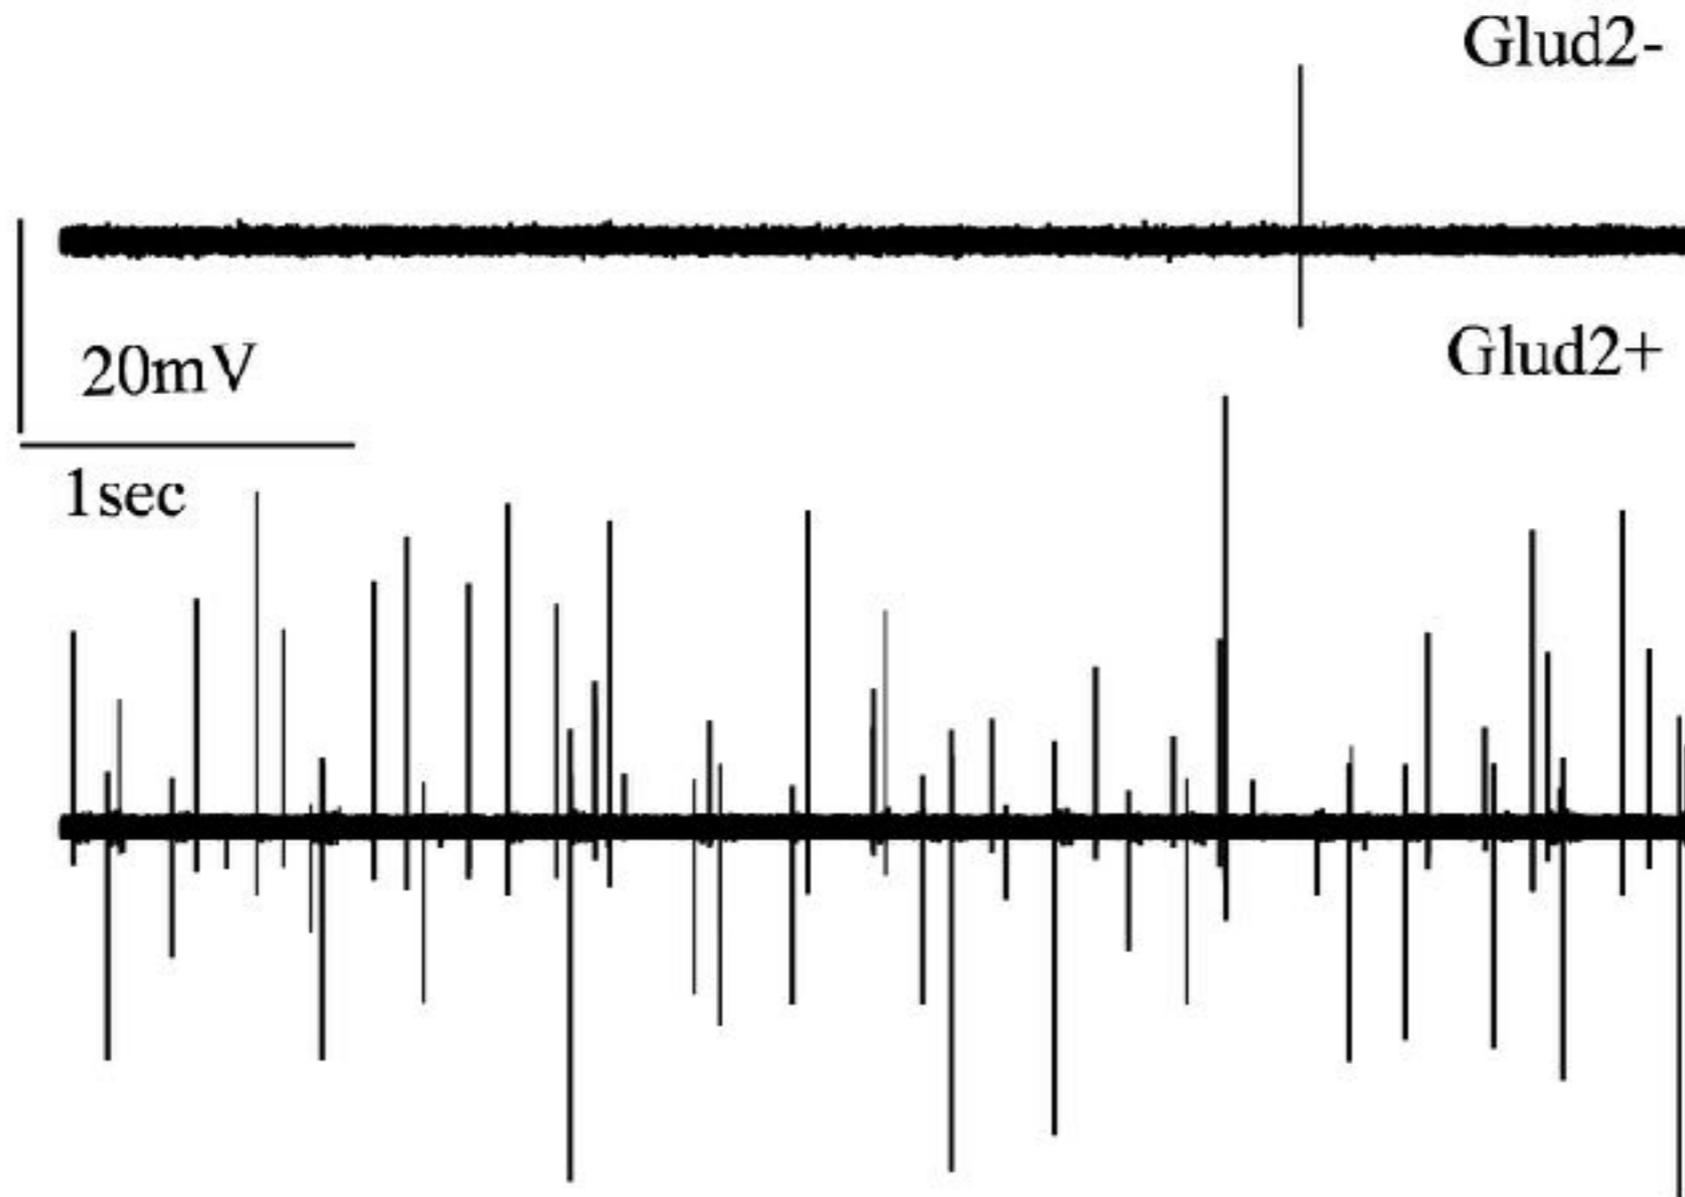

field
excitatory
post-synaptic
potential

fiber volley

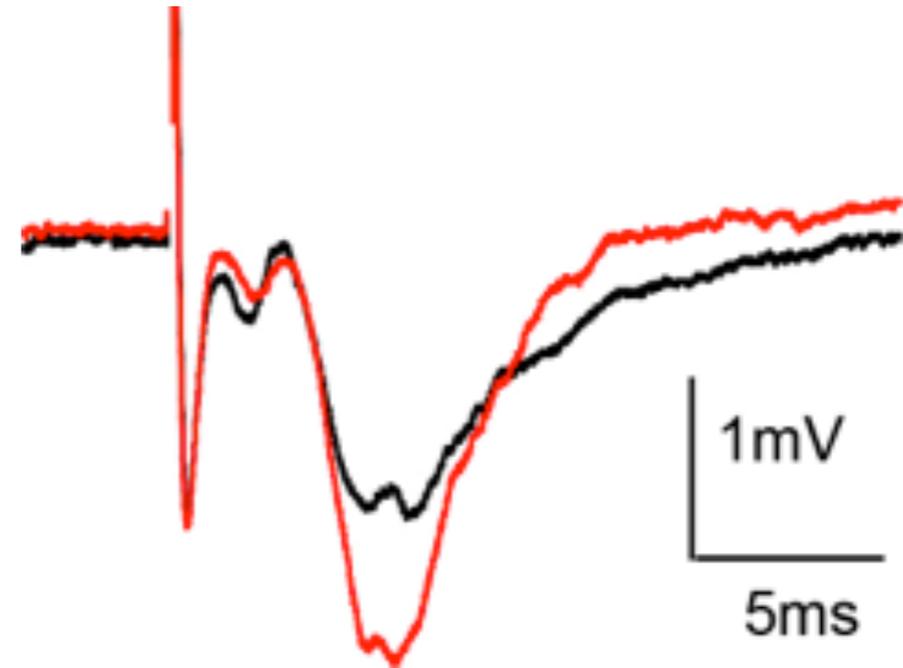

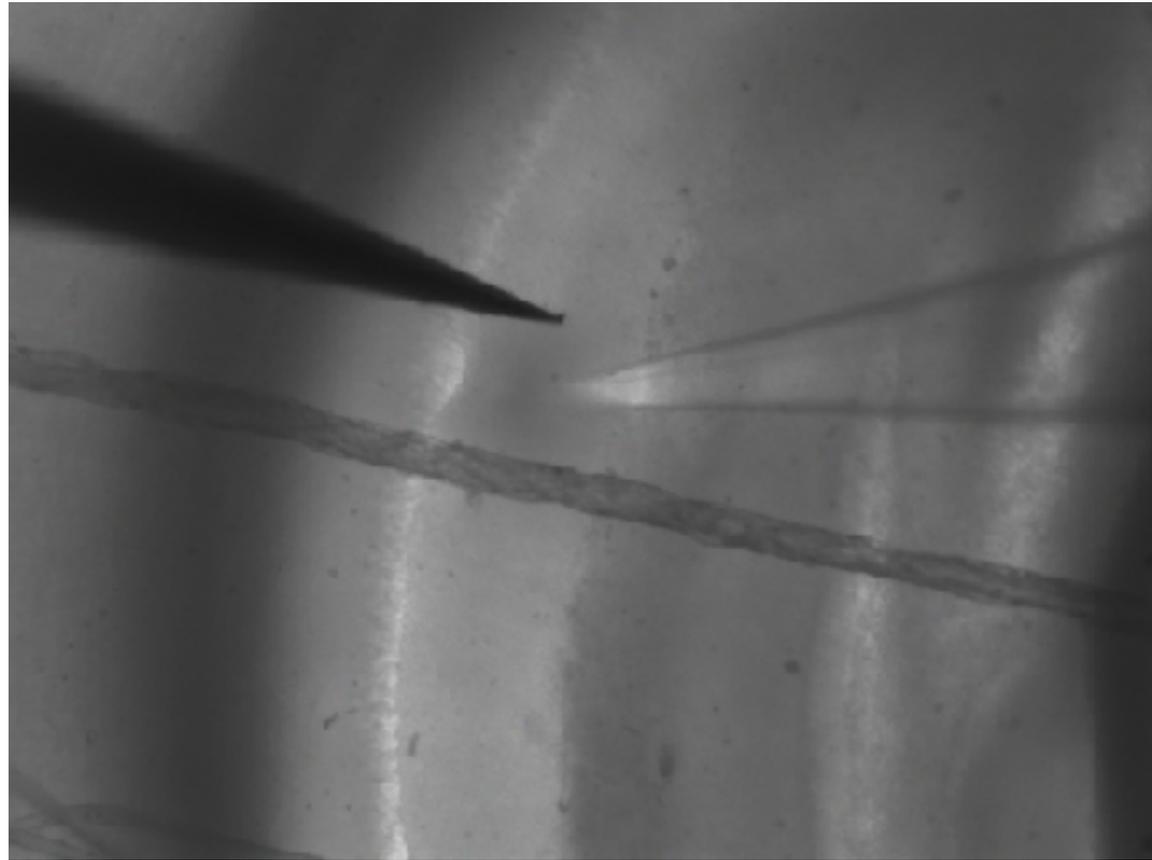

Brain slice - LFPs

- Record brain areas that are stratified
 - hippocampus
 - Cortex
- Spontaneous/Epileptiform activity
- Evoked field excitatory postsynaptic potentials (fEPSP)
- Long-term potentiation

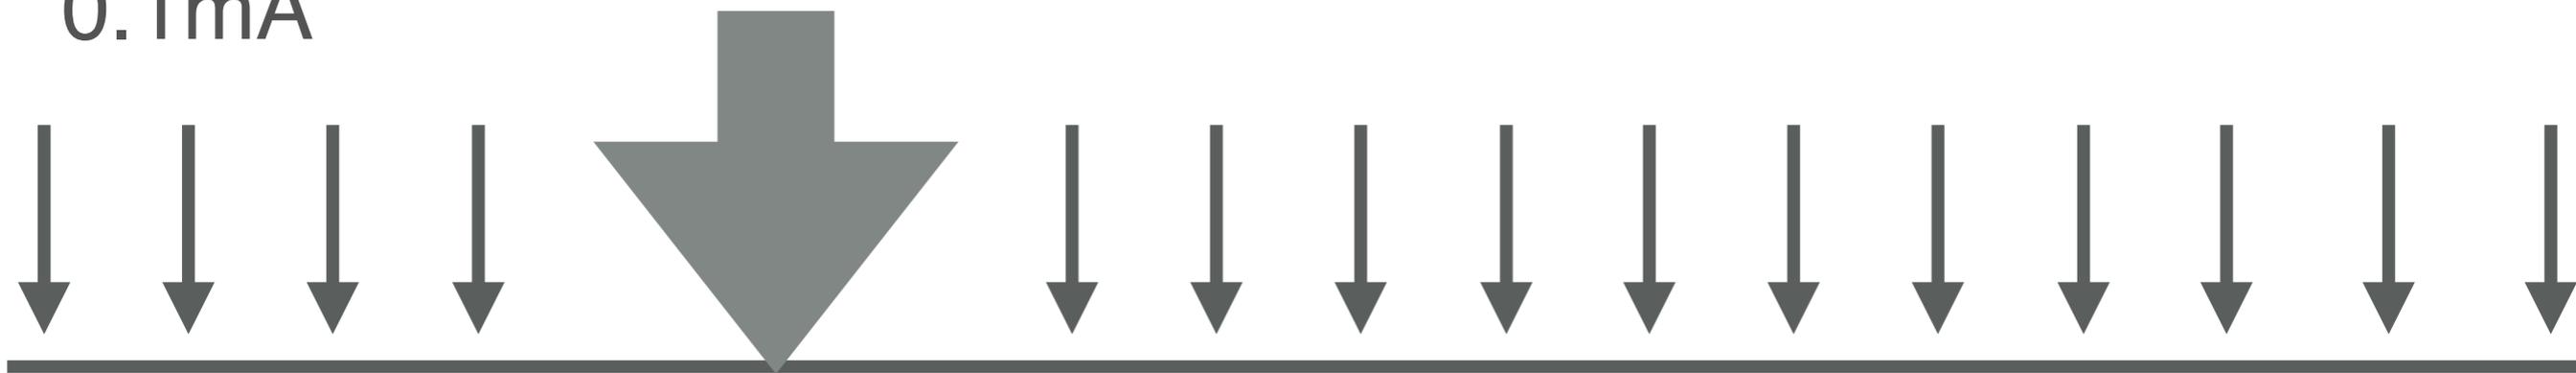

Basal spontaneous activity

Evoked LFPs - Long-term potentiation

0.1mA

Tetanus
100Hz - 1sec
3x - 20sec

10-20min

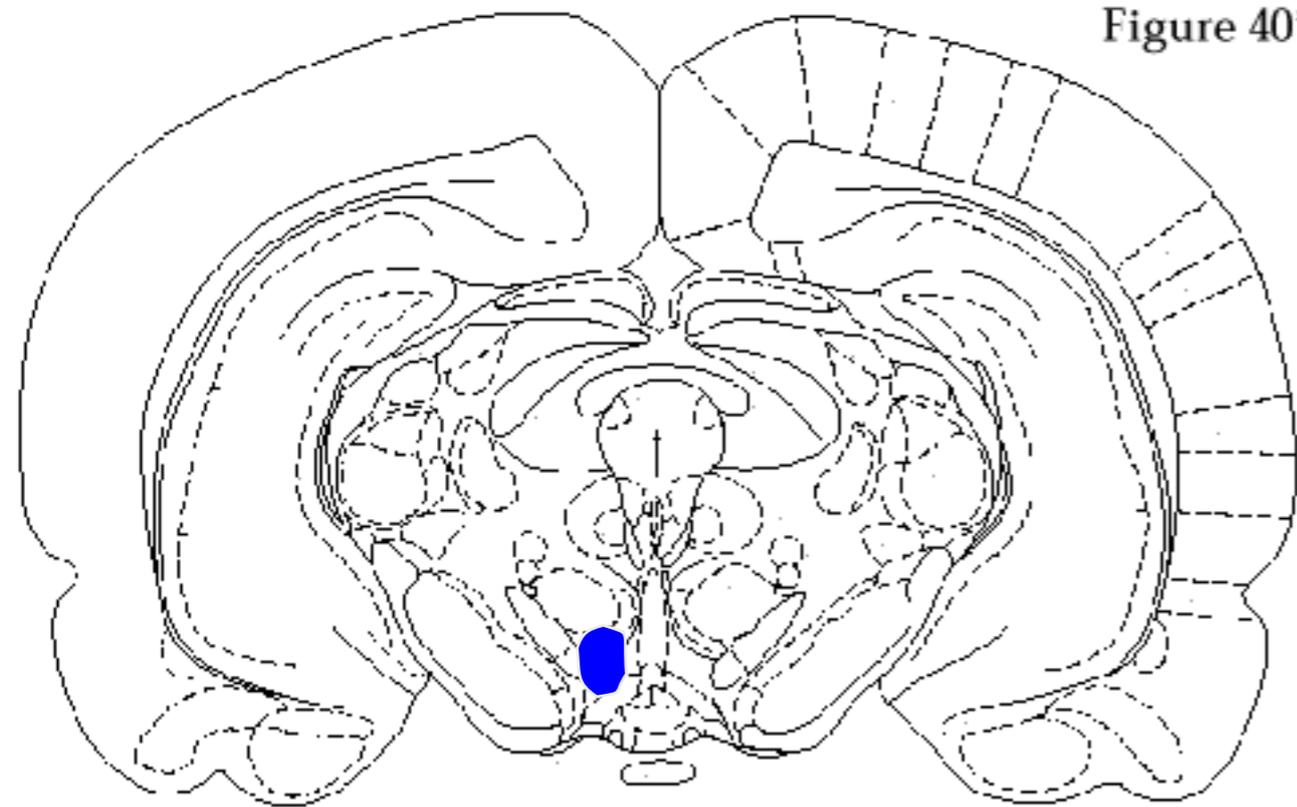

50min

Extracellular Recordings - Single unit recordings Dopamine neurons

Ventral Tegmental Area
Substantia Nigra
A8, A9, A10

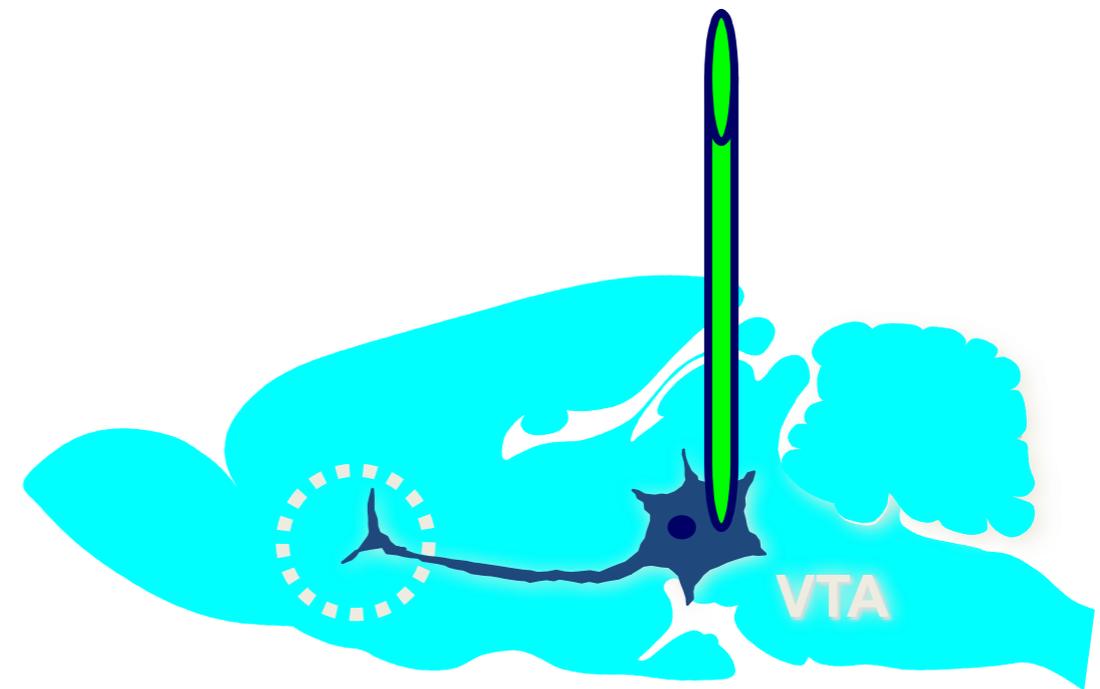

- Διαλύματα
- Ηλεκτρόδια
 - NaCl
 - Fast green

Figure 40*

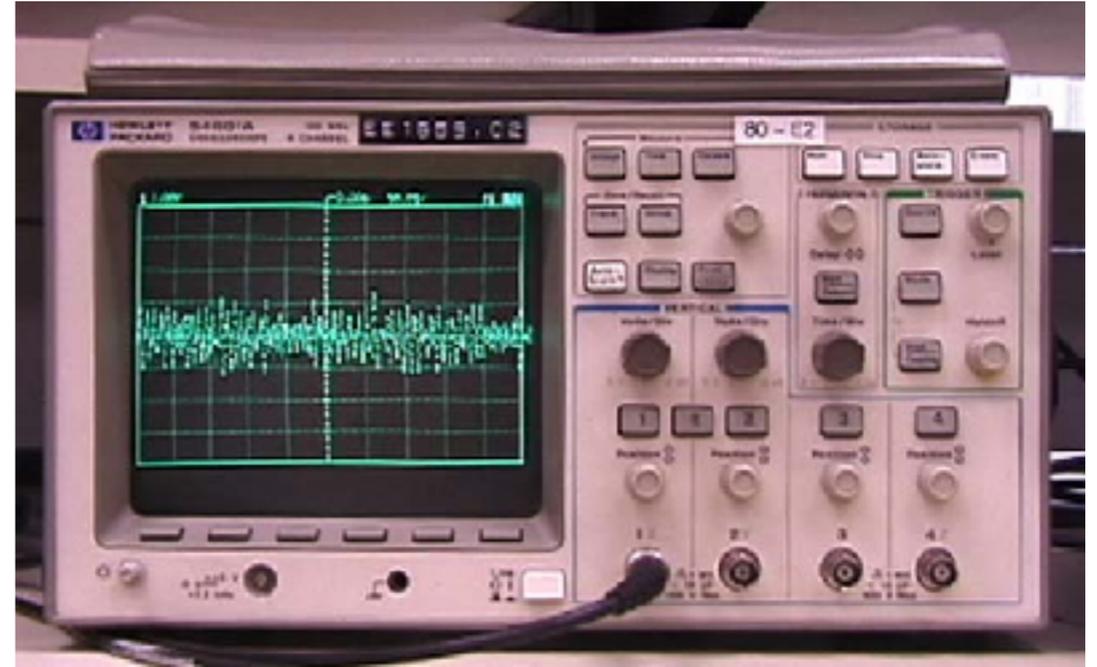

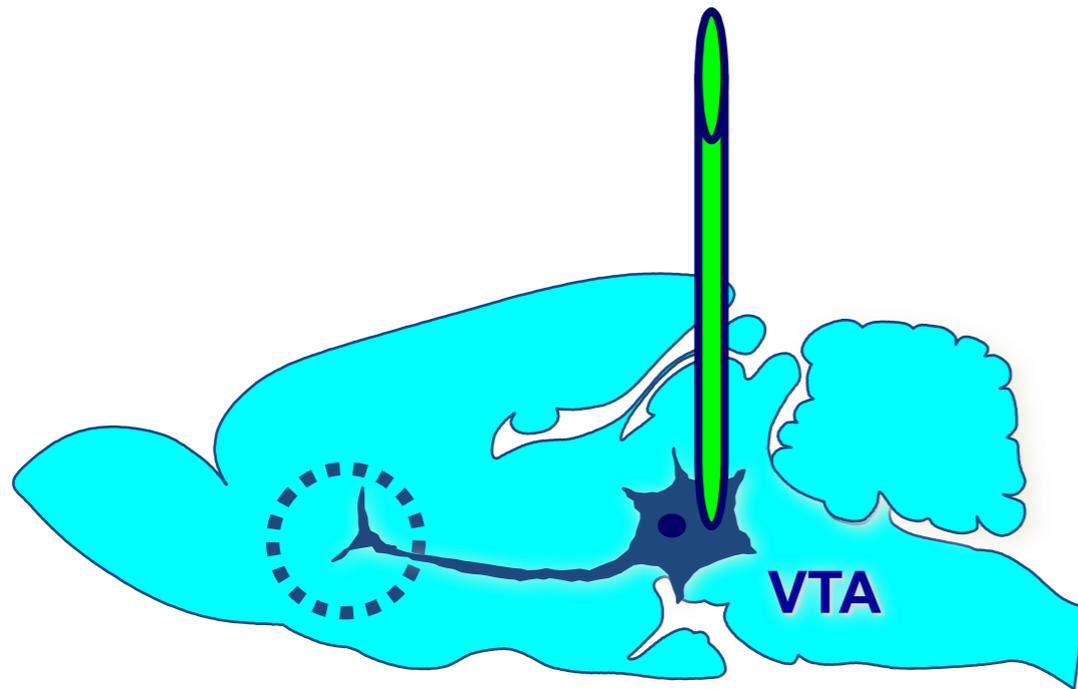

Interaural 3.40 mm*

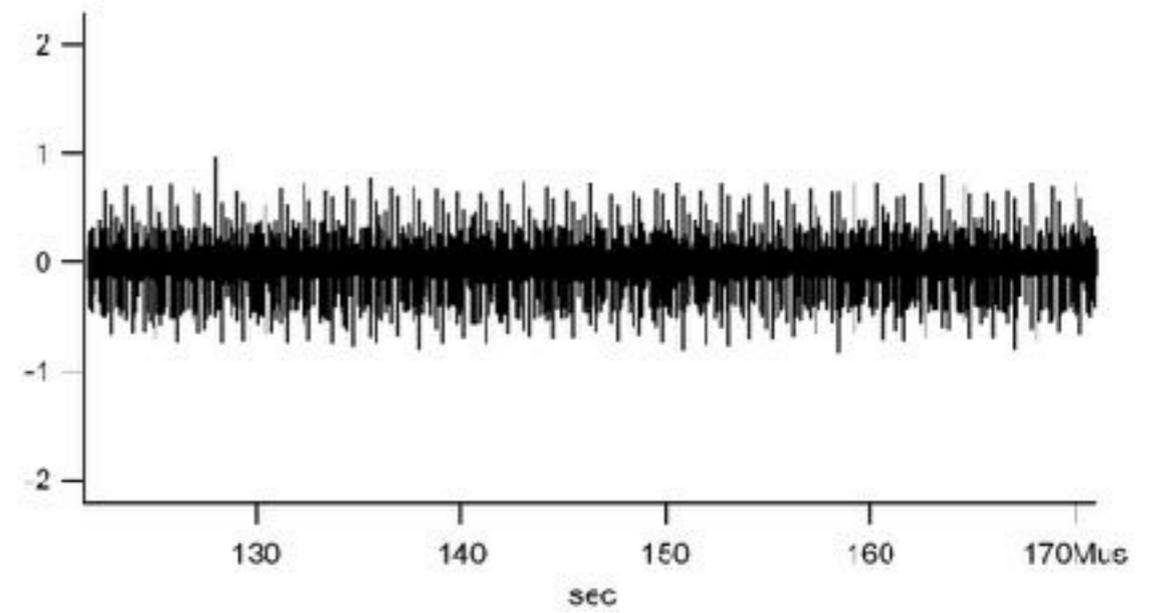

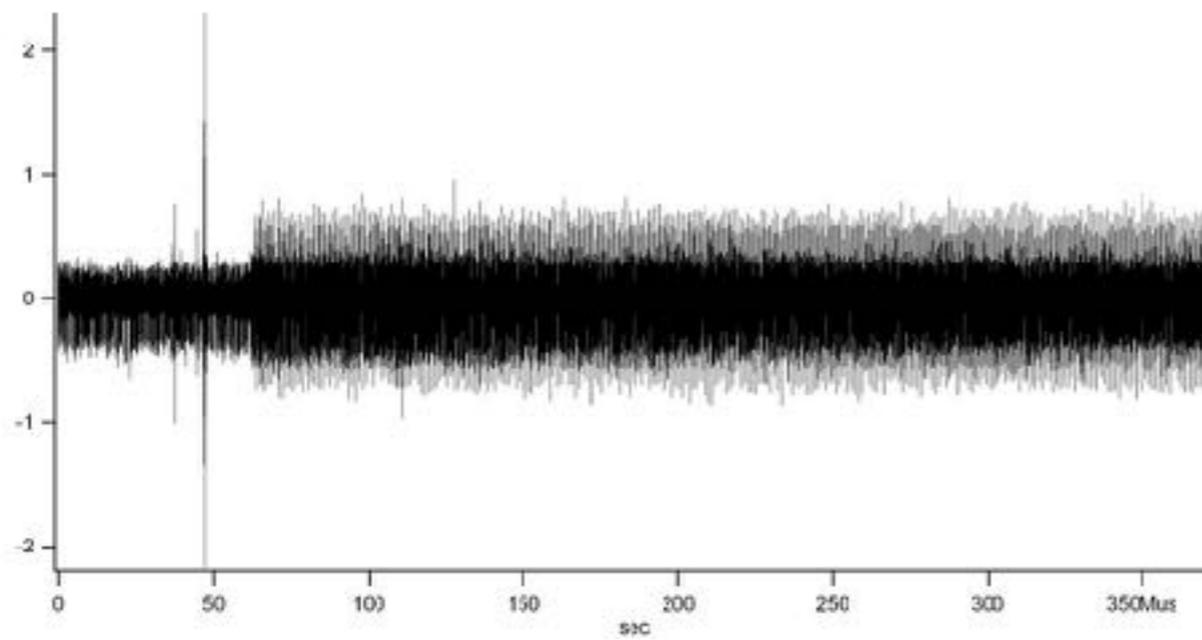

Bregma -5.60 mm

Extracellular Recordings

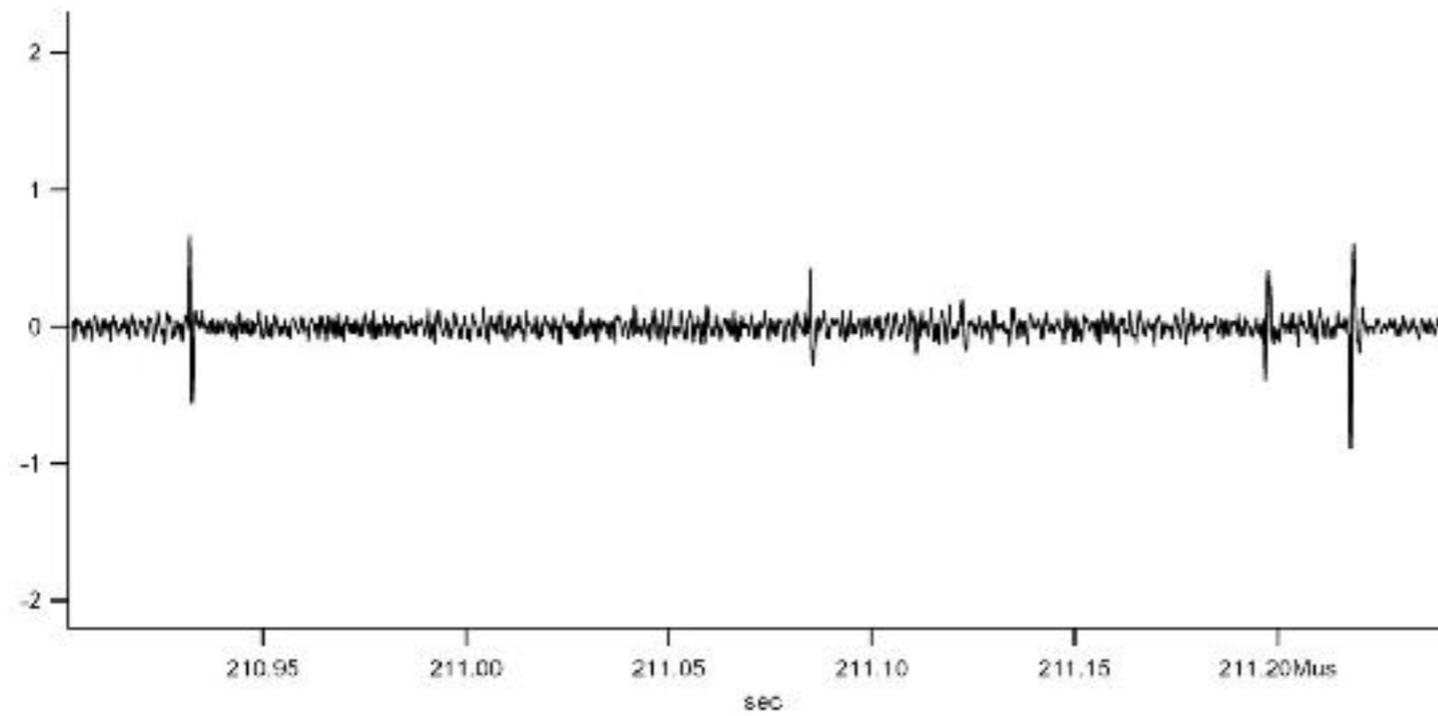

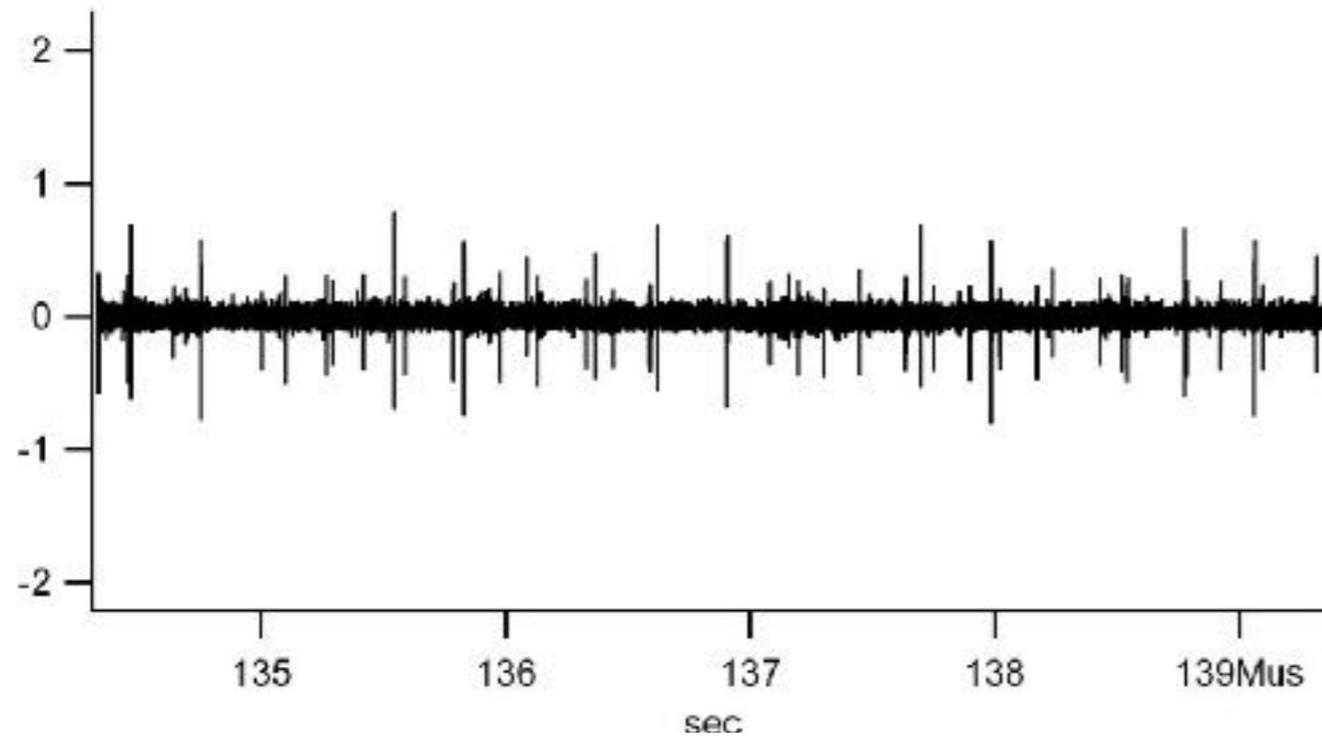

Relative voltage

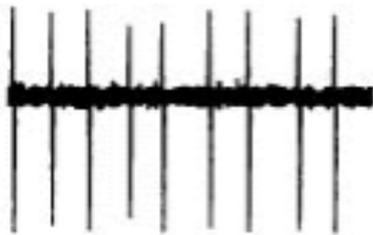

Extracellular Recordings Dopamine neurons

Relative voltage

Dopamine neuron waveforms

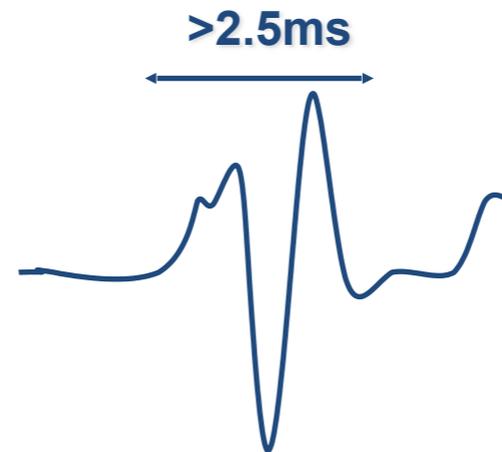

non-bursting cell

bursting cell

1.5 sec

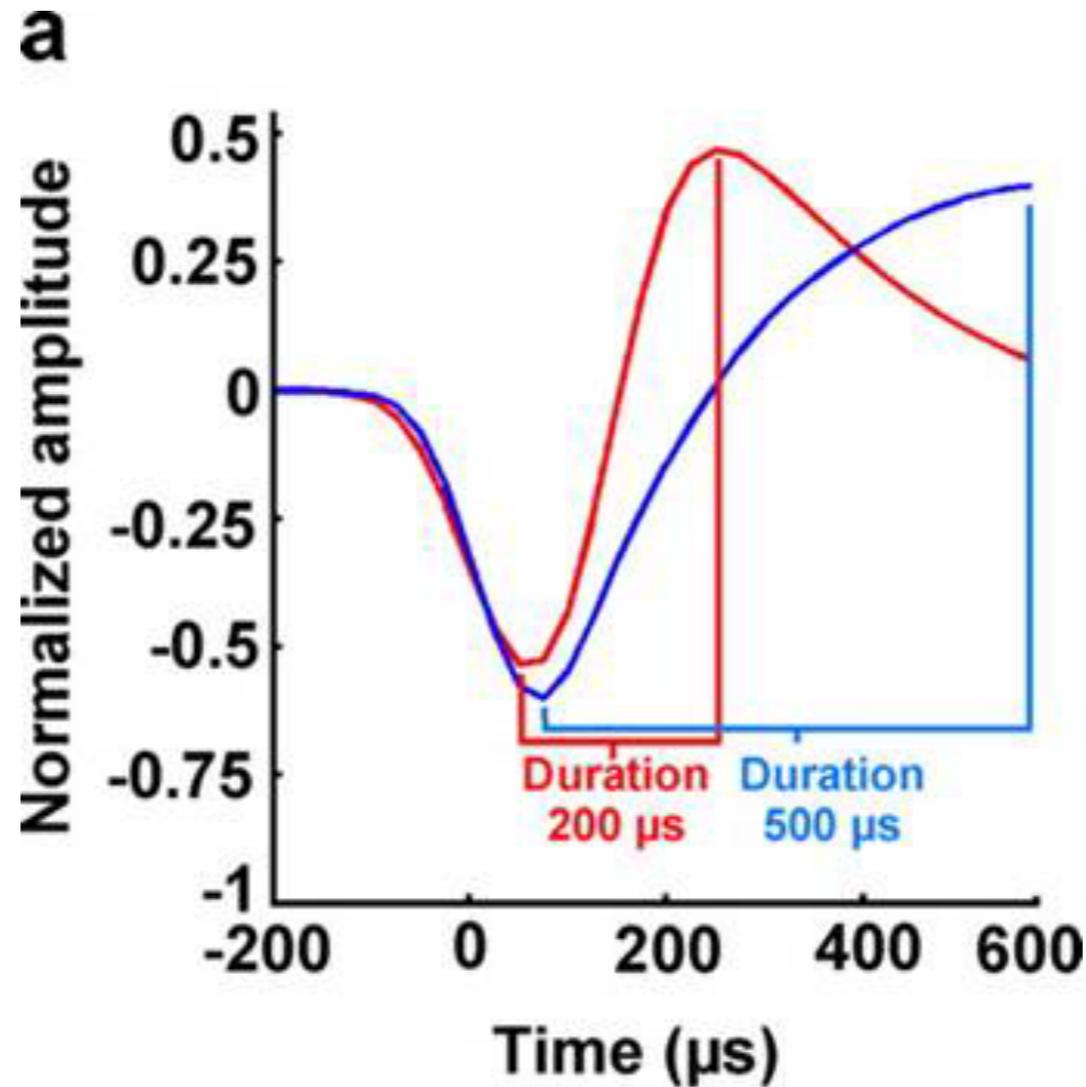

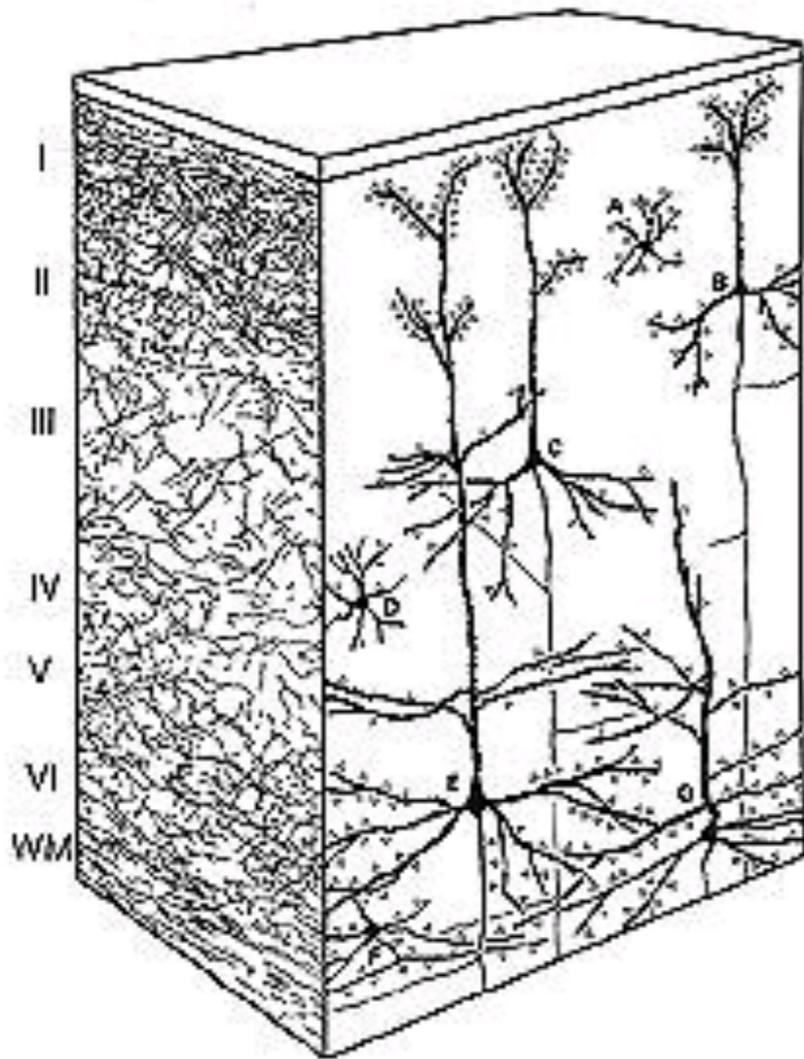

- Spontaneously active, and fire at low irregular frequencies (1-10Hz)
- Triphasic waveform of long duration
- Tonic or burst-firing

A

1 Σύνθετο κύτταρο

Receptive fields in the visual cortex

2 Ακρο-αναστελλόμενο κύτταρο

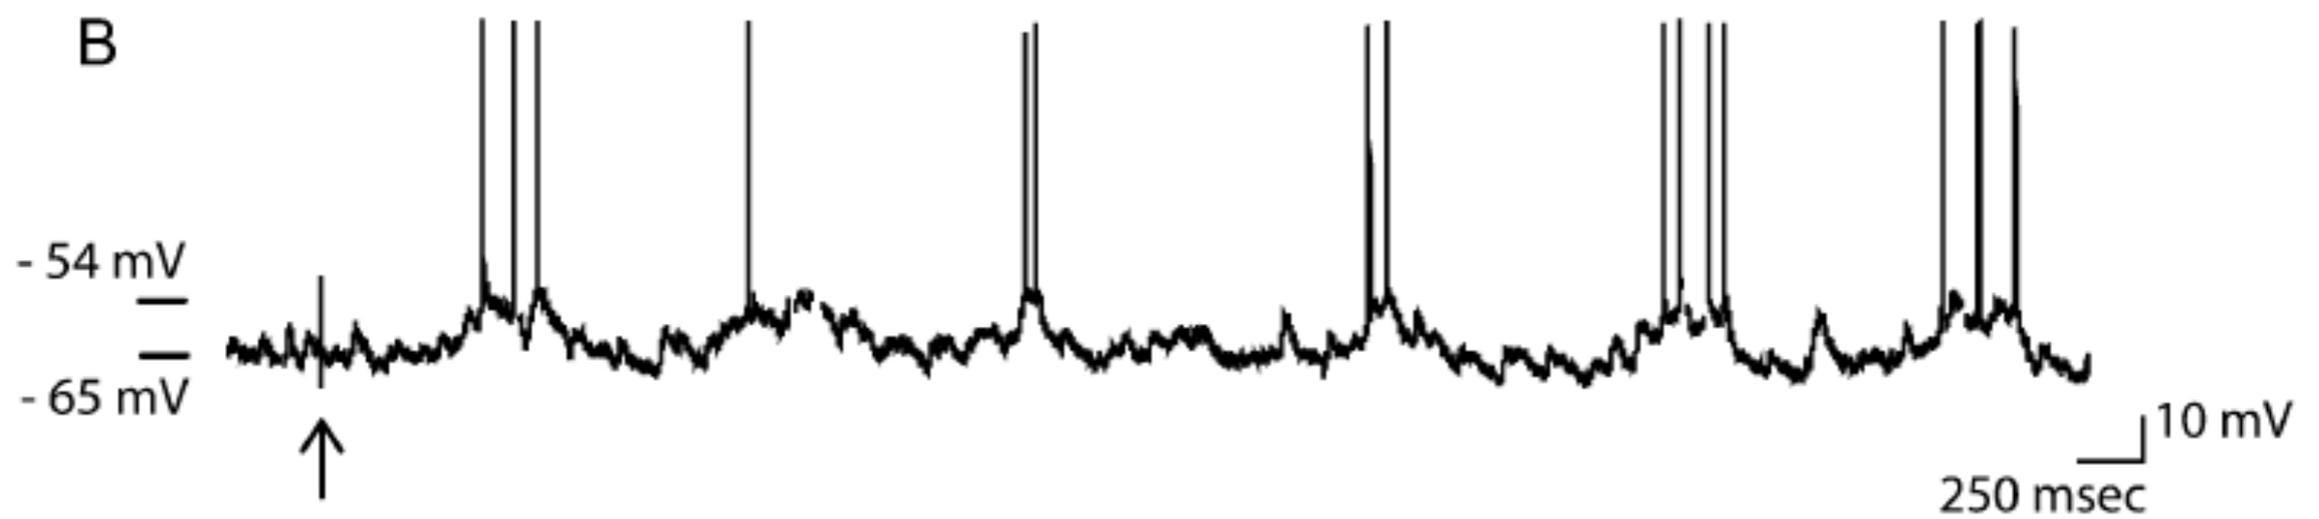

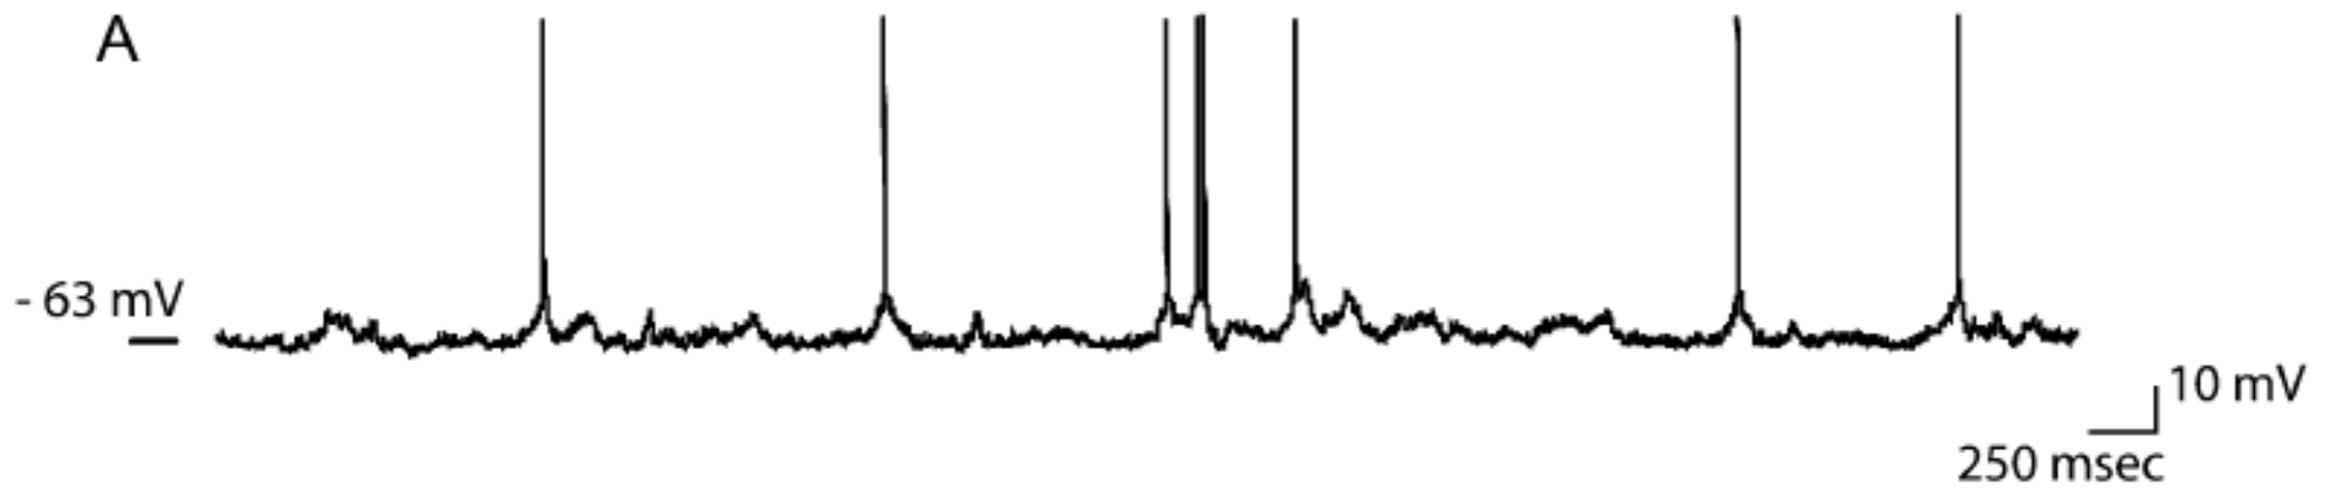

Εικόνα 23-12 Τα ακρο-αναστελλόμενα κύτταρα είναι ανώτερης τάξης σύνθετα κύτταρα που έχουν σχέση με τα χείλη, τις γωνίες και τις καμπύλες. (Από Hubel και Wiesel, 1965, τροποποιημένη.)

A. Τα κύτταρα του οπτικού φλοιού αποκρίνονται επιλεκτικά σε μια συγκεκριμένη περιοχή μηκών μιας κατακόρυφης φωτεινής γραμμής. 1. Η απόκριση αυτού του σύνθετου κυττάρου αυξάνεται καθώς το μήκος της γραμμής αυξάνεται μέχρι 2° περίπου, ενώ έπειτα δεν υπάρχει μεταβολή. 2. Η απόκριση αυτού του ακρο-αναστελλόμενου κυττάρου βελτιώνεται, καθώς η γραμμή αυξάνεται μέχρι 2°, αλλά κατόπιν μειώνεται, έτσι ώστε μια γραμμή 6° ή μεγαλύτερη δεν προκαλεί απόκριση.

Functional imaging techniques

- **Calcium imaging**
- Voltage imaging
- PET
- MRI, fMRI
- Real-time imaging

Calcium imaging

- Calcium cannot be measured directly
- Calcium indicators used
 - Calcium-binding molecules are used that change their fluorescence properties
 - calcium changes can be measured in multiple milliseconds (compared to microseconds in electrophysiology)
- Requirements for successful calcium imaging
 - fast calcium indicator
 - high signal-to-noise ratio
 - proper instrumentation (images without photobleaching, fast scanning)

Advantages compared to recording techniques

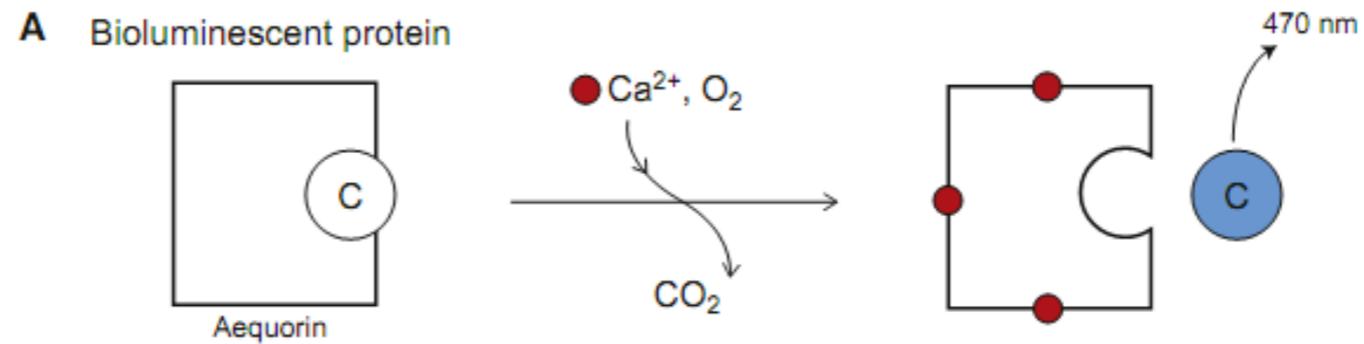

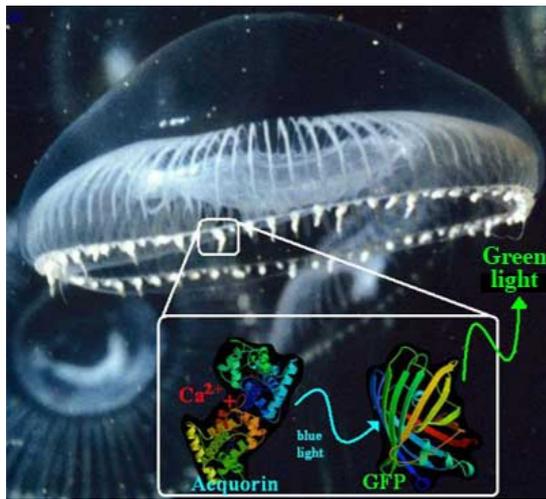

- Multiple cells
- Cell-type identification

Calcium -imaging video of spontaneous neuronal activity,
Golshani Lab, UCLA, [http://golshanilab.neurology.ucla.edu/
techniques](http://golshanilab.neurology.ucla.edu/techniques)

Molecules used for calcium imaging

- Natural calcium-binding proteins with fluorescent properties, aequorin

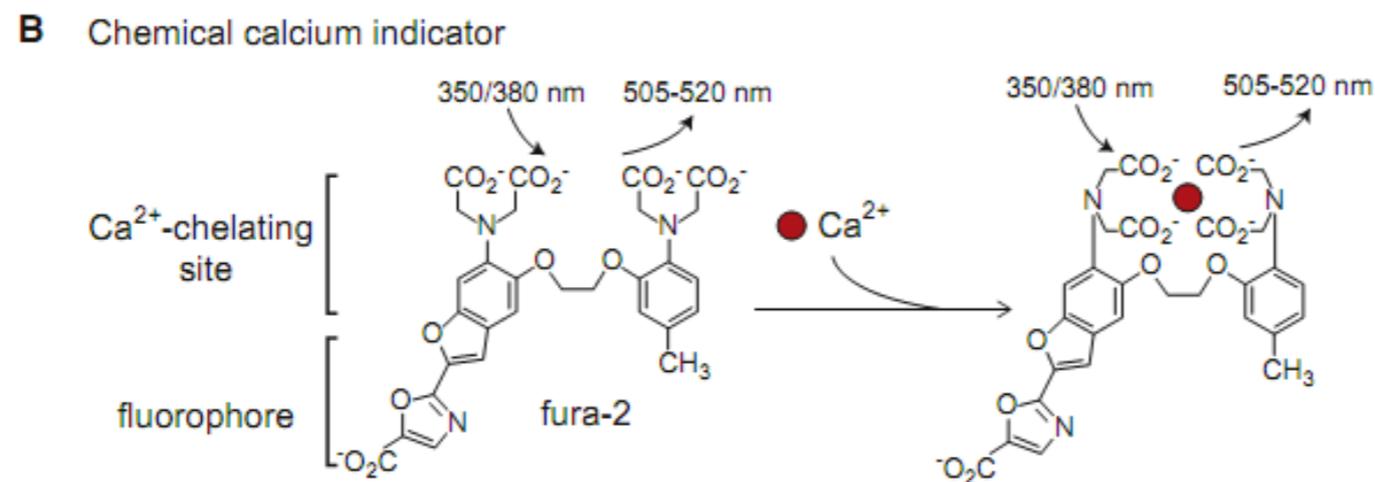

- Synthetic chemicals
- Genetically modified calcium indicators

Synthetic chemical compounds

- Fura-2/Fura-2AM (membrane permeable)
- BAPTA-AM
- Orange green

Roger Tsien
Nobel prize in chemistry 2008
Green Fluorescent Protein

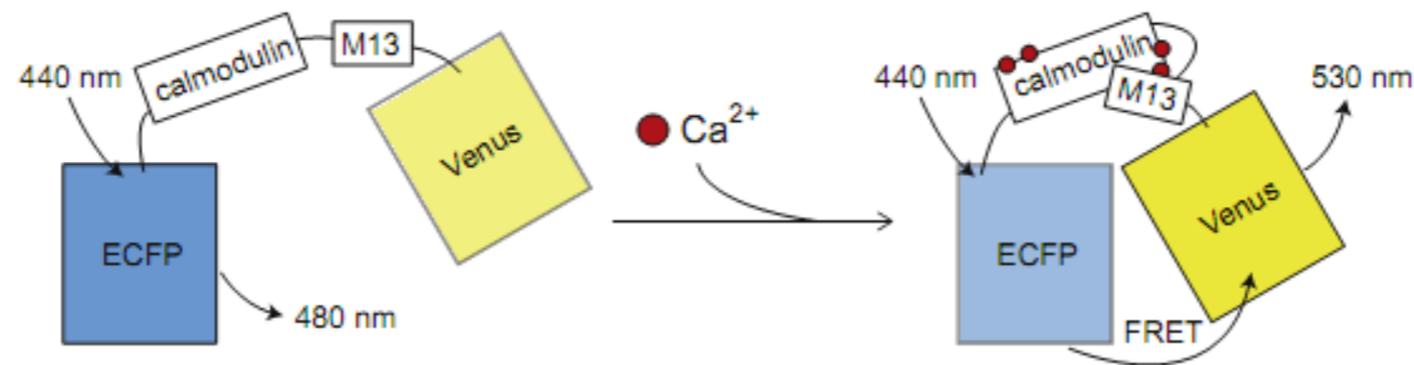

Genetic calcium indicators

- Forster resonance energy transfer (FRET)
- Yellow cameleon
- Two fluorescent substances (donor and recipient)

Orange stripes: sample periods with nontarget tones,

Dashed line: end of response window in CR trials.

Black tick on top: lick response.

Blue arrowheads: delivery of reward

Orange arrowheads: punishment

Optogenetics

Ed Boyden, MIT

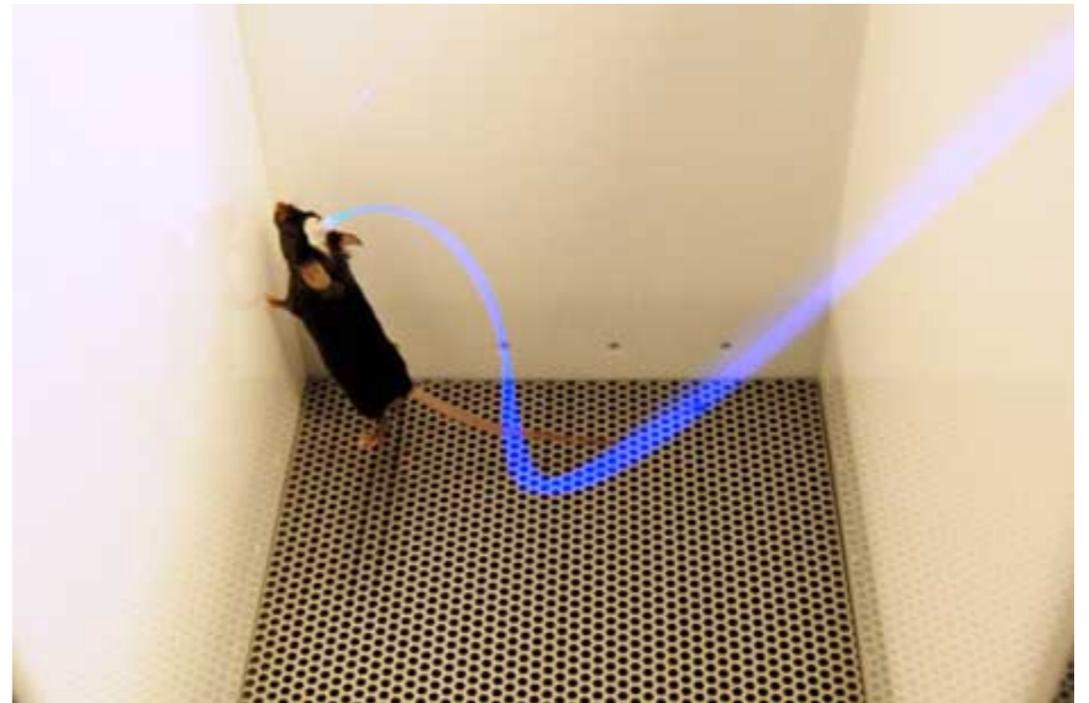

Karl Deisseroth, Stanford

Optogenetics

"The major challenge facing neuroscience was the need to control one type of cell in the brain while leaving others unaltered. Electrical stimuli cannot meet this challenge."

- Francis Crick

Optogenetics

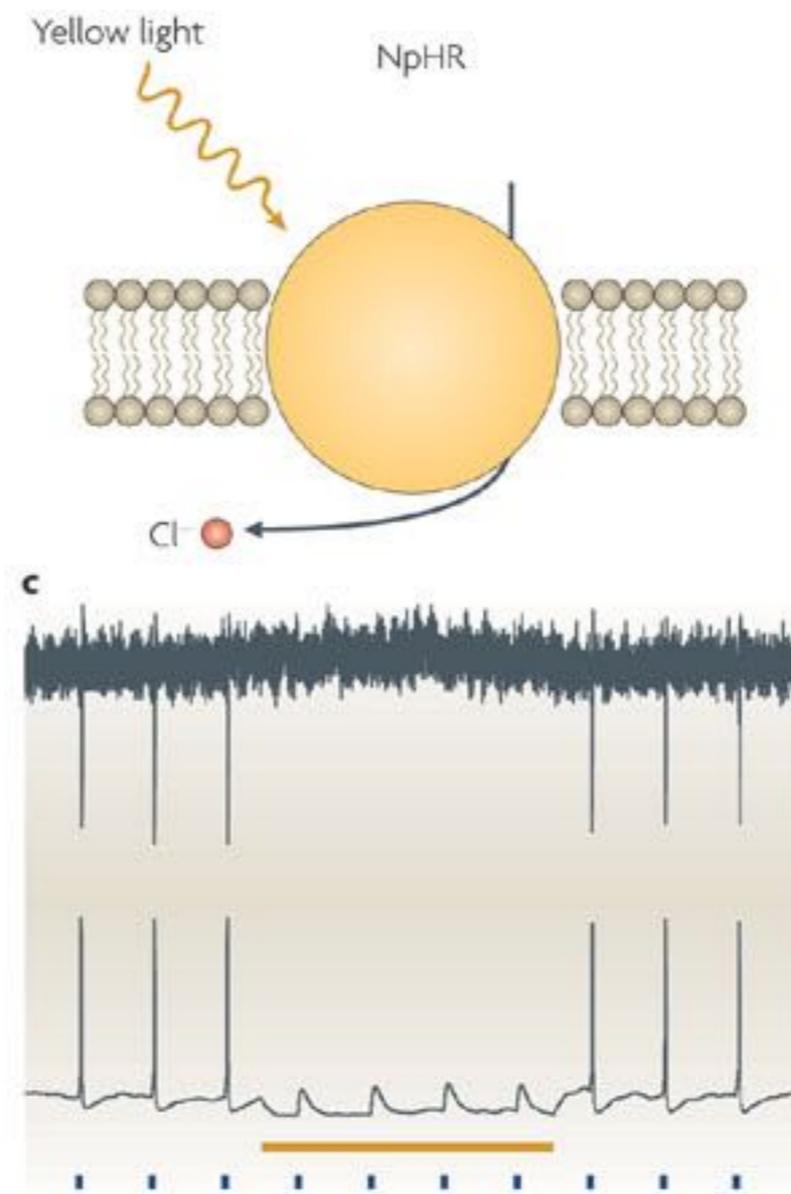

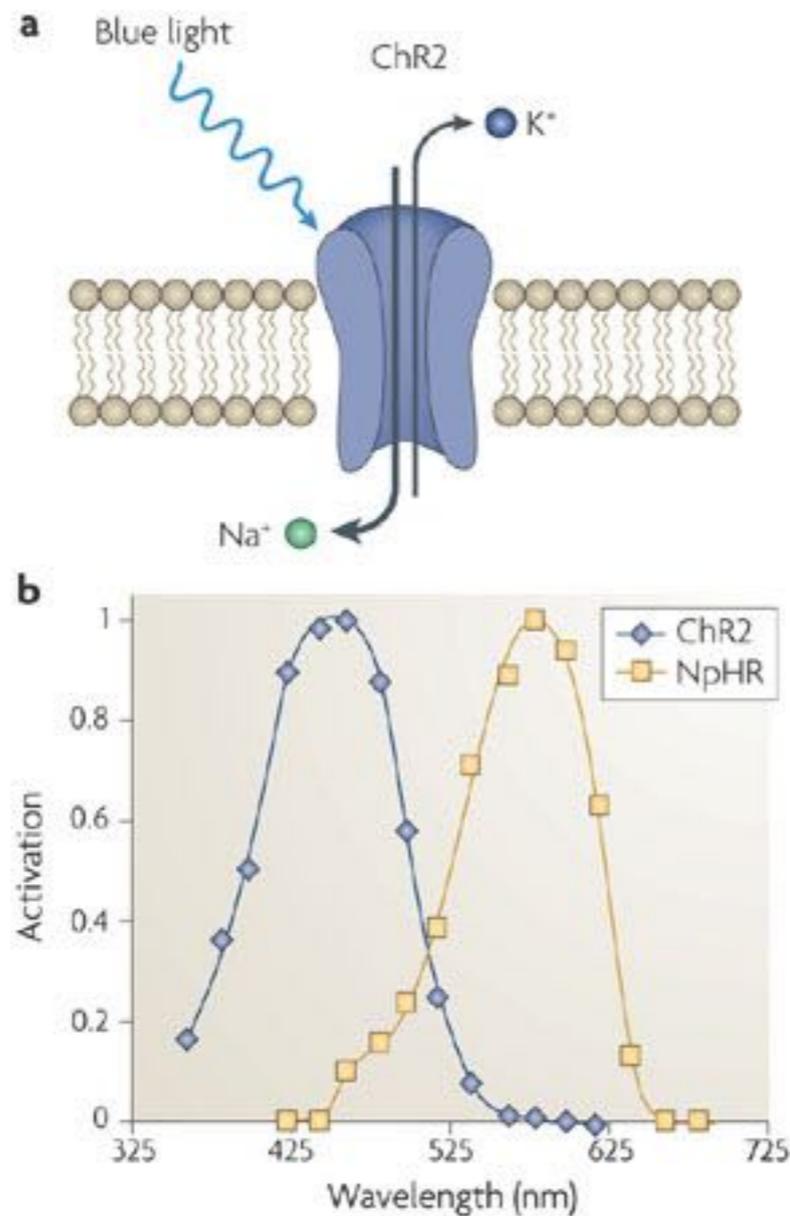

- Combination of optical and genetic techniques for specifically controlling neuronal subtypes
- Use of ion channels that are activated by light, are expressed in archeobacteria and not expressed in animals

Channels used to control excitability

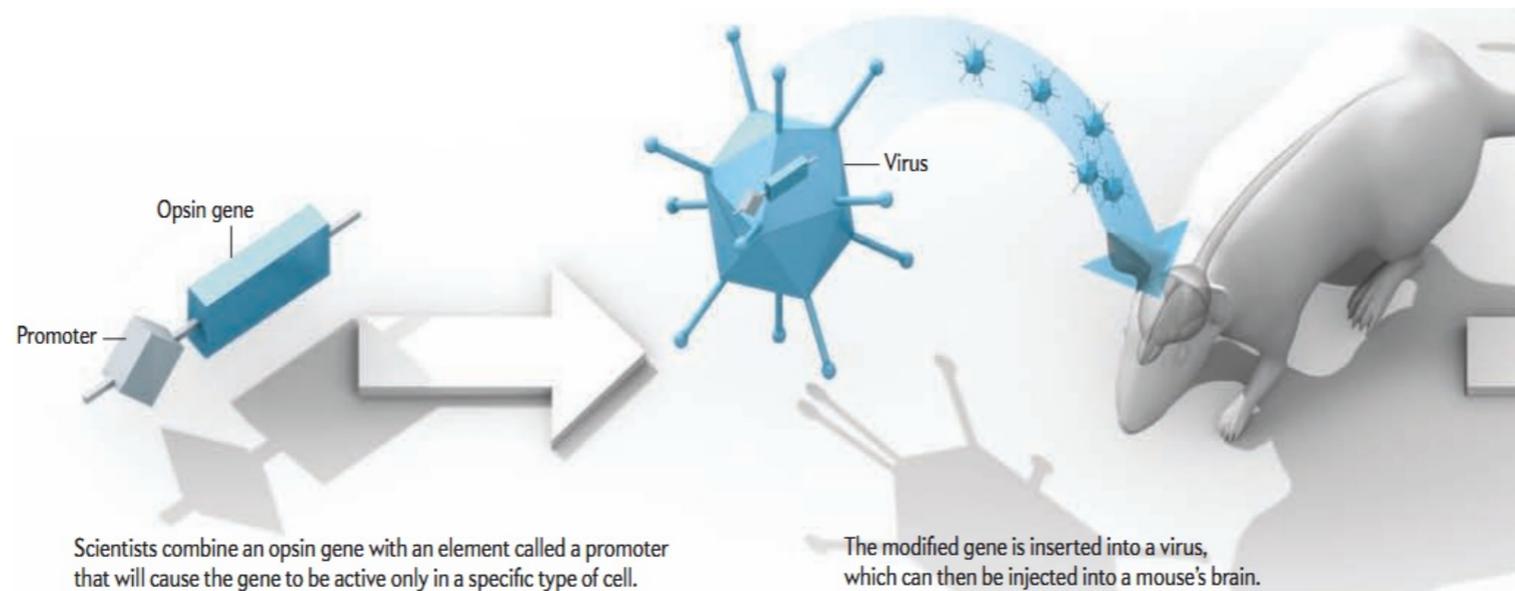

Opsins

Chlamydomonas reinhardtii
Channelrhodopsin-2

Natronomonas pharaonis
Halorhodopsin

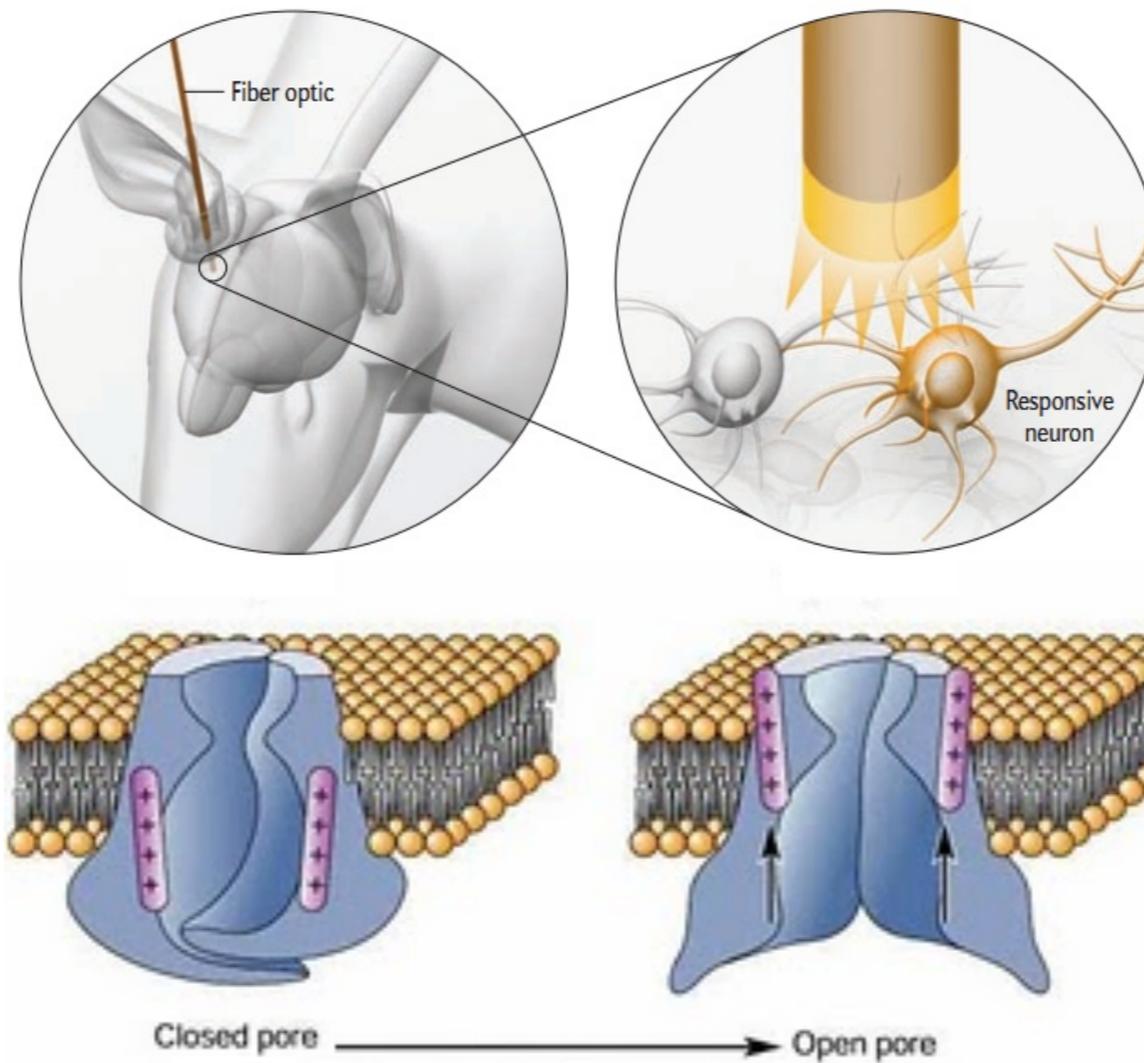

Step 1: Expression of opsin in the desired neuronal population

- Viral transfection
- Use of Cre-loxP system in mice
- PV-cre mice
- Som-cre mice
- CamKII-cre mice

Step 2: Activate opsin with light
